Axion miniclusters and implications for axion detection

Tuesday, 21 May 2019 11:00 (1 hour)

Axions and axion-like particles are excellent dark matter candidates, spanning a vast range of mass scales from the milli- and micro-eV for the QCD axion, to even lighter candidates that make up the “axiverse”. In some scenarios, inhomogeneities in the axion density lead to the formation of compact structures known as axion “miniclusters” and axion stars. Topological defects in the early universe might also contribute the energy density of axions and generate primordial gravitational waves that can possibly be detected in future experiments. I will first discuss astrophysical and cosmological constraints on axions at either end of this spectrum, using data from the cosmic microwave background anisotropies and the effects of miniclusters on the gravitational microlensing and on direct detection. I will then assess the formation and the evolution of axion stars in various astrophysical regimes.

Presenter: VISINELLI, Luca (Uppsala Univ.)

Nambu-Goldstone bosons in Cosmology

Wednesday, 22 May 2019 11:00 (1 hour)

Presenter: DI LUZIO, Luca (Istituto Nazionale di Fisica Nucleare)

Contribution ID: 4

Type: **not specified**

Neutral hadrons disappearing into the darkness

Wednesday, 22 May 2019 14:30 (1 hour)

Presenter: BARDUCCI, Daniele (Istituto Nazionale di Fisica Nucleare)
