# Outline

- 1 Motivation
- 2 Detector and strategy
- 3 Expected results
- 4 Data from LHC
- 5 Conclusions

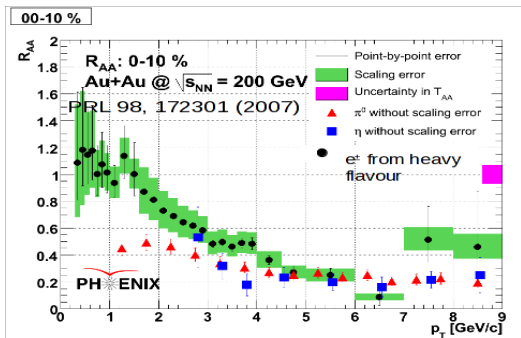

# Motivation for Heavy Flavour studies in ALICE

- The aim of the ALICE experiment is to study the properties of the deconfined medium formed in **high energy heavy ion collisions**, the Quark Gluon Plasma
- **Hard probes** such as heavy quarks are a good tool to investigate the properties of the QGP
  - ⇒ At LHC energies early production of heavy quarks ( $gg \rightarrow Q\bar{Q}$ ) (0.08 fm/c for charm) **before QGP formation** ( $\sim 1$  fm/c)
  - ⇒ **Open charmed mesons**: good probes for nuclear effect on charm production, propagation and hadronization in the “hot” medium
- **p-p** and **p-A** collisions: important role in ALICE physic program to give a **benchmark** for Pb-Pb result and test the **pQCD** predictions in an unexplored energy domain

# Results from RHIC and perspectives at LHC

- RHIC experiments observe hadrons suppression in central collisions interpreted as energy loss
- Indirect look to open c/b performed  $D/B \rightarrow e^\pm + X$

$$R_{AA}(p_T) = \frac{d^2 N_{AA}/dp_T dy}{N_{coll} \times d^2 N_{pp}/dp_T dy}$$

- At LHC, ALICE will measure charm directly thanks to the exclusive reconstruction of the hadronic decays

# In medium energy loss

- Quarks experience energy loss in the medium for instance by gluon radiation (“gluonsstrahlung”)

- radiative energy loss ( $\langle \Delta E \rangle \propto \alpha_s C_R \hat{q} L^2$ ), correlated to the medium density through  $\hat{q}$ , depends on **mass** and **colour charge**

- ★ Radiation suppressed at **small angles** for massive partons (Dead-cone effect)

Yu.L. Dokshitzer and D.E. Kharzeev, Phys. Lett. B519 (2001) 199, arXiv:hep-ph/0106202

- ★ Casimir Factor ( $C_R$ ) 4/3 for quarks, **3 for gluons**
- Therefore it is particularly important to measure heavy quark energy loss

# ALICE detector and Heavy Flavours at mid-rapidity

# ALICE - LHC pp@7TeV

- First collisions @7TeV 30th March 2010

# ALICE detector and Heavy Flavours at mid-rapidity

- Charm cross section and energy loss will be studied in particular with  $D^0 \rightarrow K^- \pi^+$ ,  $D^+ \rightarrow K^- \pi^+ \pi^+$ ,  $D^{*+} \rightarrow D^0 \pi^+$ ,  $D_s^+ \rightarrow K^+ K^- \pi^+$ ,  $D^0 \rightarrow 4\pi$  and – under study –  $\Lambda_c \rightarrow K^- \pi^+ p$  ( $c\tau \sim 50 \div 350 \mu\text{m}$ )

- The vertex resolution is provided by the ITS detector (SPD+SDD+SSD) and in particular by the inner layers of pixels (SPD)

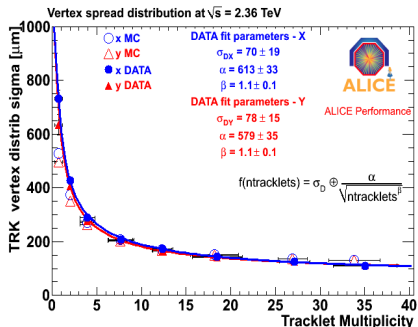

# ALICE detector and Heavy Flavours at mid-rapidity

- Charm cross section and energy loss will be studied in particular with  $D^0 \rightarrow K^- \pi^+$ ,  $D^+ \rightarrow K^- \pi^+ \pi^+$ ,  $D^{*+} \rightarrow D^0 \pi^+$ ,  $D_s^+ \rightarrow K^+ K^- \pi^+$ ,  $D^0 \rightarrow 4\pi$  and – under study –  $\Lambda_c \rightarrow K^- \pi^+ p$  ( $c\tau \sim 50 \div 350 \mu\text{m}$ )

Simulated Impact parameter resolution  
Pb-Pb central

Data Vertex resolution  $\sqrt{s} = 2.36 \text{ TeV}$   
with  $B = 0.5 \text{ T}$

# Invariant mass analysis - MC pp@10TeV

- Invariant mass analysis:
  - Topological cuts to select displaced secondary vertices (significance maximization)
  - Subtraction of remaining background (fit, like-sign, rotation and mixing technique)
  - Feed-down from B
  - Yield correction with efficiencies
  - Calculation of exclusive charm cross section

Example from MC

# Invariant mass analysis - MC pp@10TeV

- Invariant mass analysis:
  - Topological cuts to select displaced secondary vertices (significance maximization)
  - Subtraction of remaining background (fit, like-sign, rotation and mixing technique)
  - Feed-down from B
  - Yield correction with efficiencies
  - Calculation of exclusive charm cross section

$10^7$  Pb-Pb central events @5.5TeV

Example from MC

# Expected performance for $D^0$ $d\sigma/dp_t$ from MC

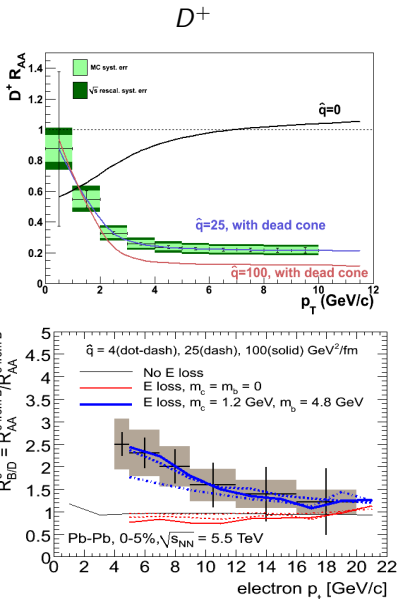

- Expected  $D^0$  production for different systems and compared to theory for pp

# Expected distributions from MC

- The  $R_{B/D}^e$  is the ratio between the  $R_{AA}$  of B and D mesons decaying in  $e^- + X$

# Conclusions

- The aim of the ALICE experiment is to study the properties of the deconfined medium formed in high energy heavy ion collisions
- Heavy flavoured mesons are good probes as they experience the whole deconfined phase
- Necessary tools to detect D(B)-mesons are good vertexer and tracker
- Heavy flavour measurements in pp are integral part of ALICE program
- Detector and analysis chain are ready: first look at background in LHC data shows agreement with MC
- Already 7M of pp events @7TeV collected from March the 30th and expected Pb-Pb in autumn
