Outline

- TB module geometry
- Background studies

TB Module geometry

- TB Module geometry modeled according to CAD design.
- To be added:
 - Csl Crystals
 - Support Box
 - Upstream detectors
- Some preliminary studies already possible

Deposited Energy

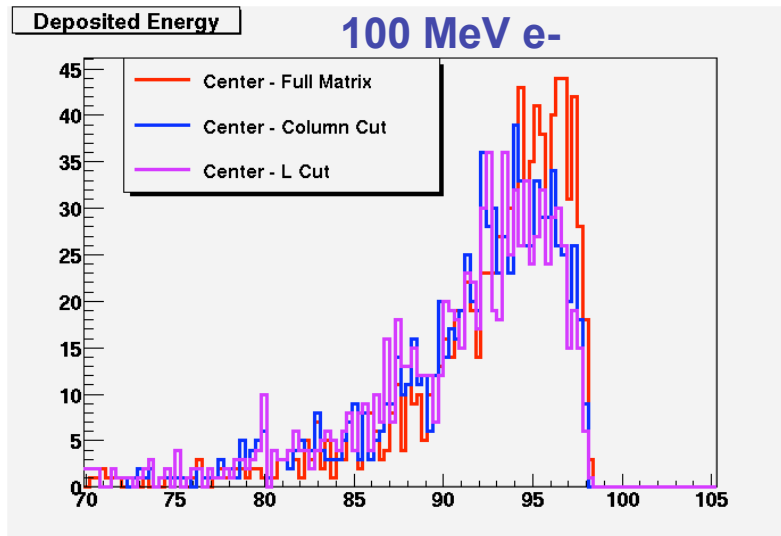

Beam at Center

Column Cut

L Cut

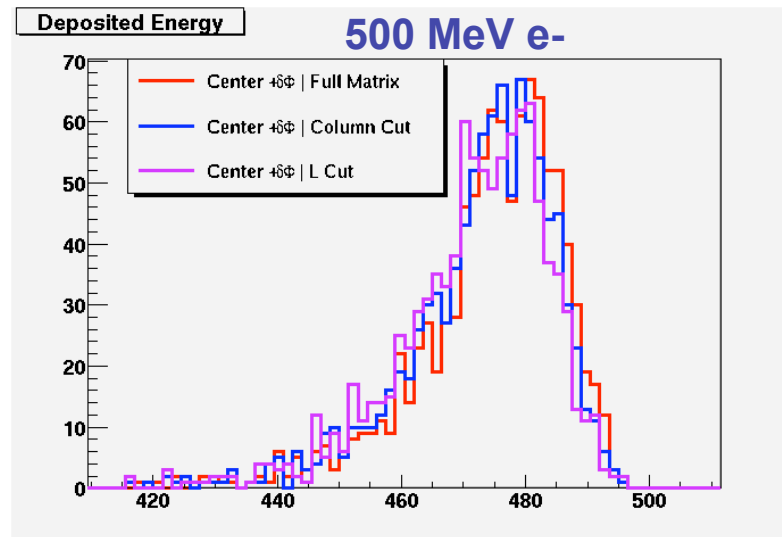

Deposited Energy

Beam at Center - $\delta\phi$

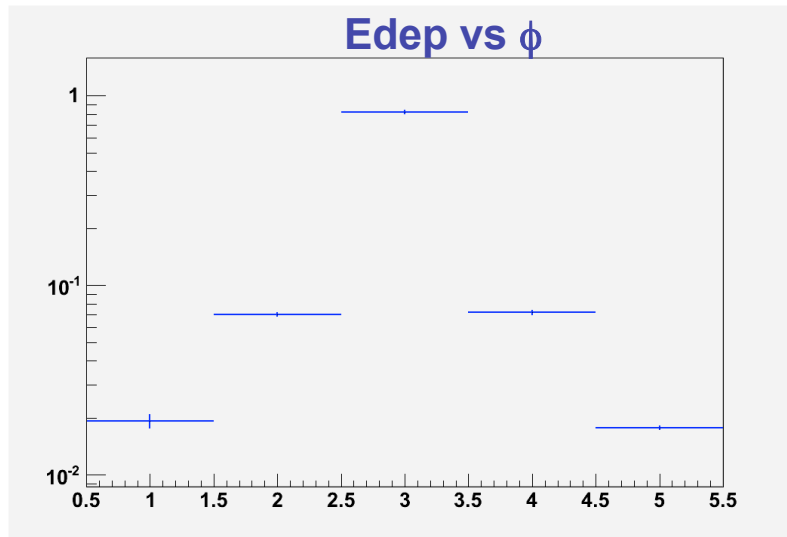

Beam at Center + $\delta\phi$

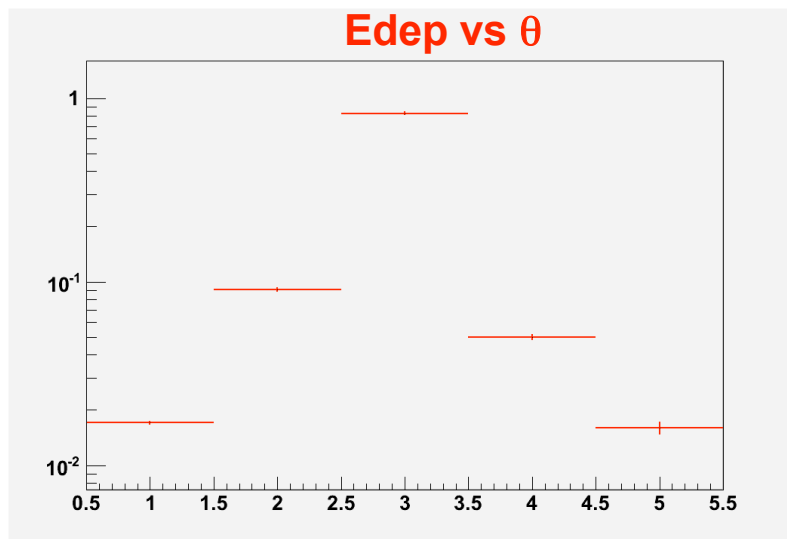

Fraction of energy deposit vs Crystal position

- 500 MeV e- at matrix center
- Average Edep vs Crystal position
- ~2% Energy deposit in the external Rows or Columns

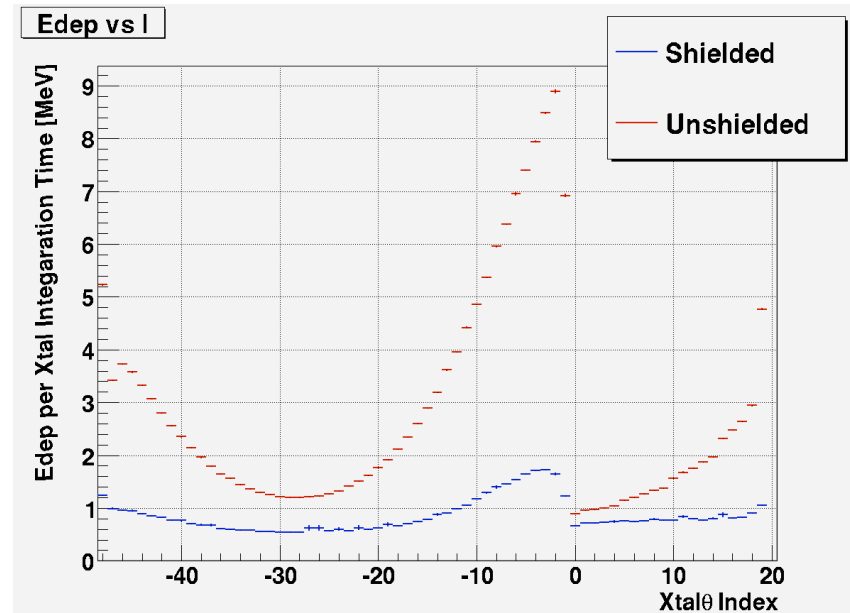

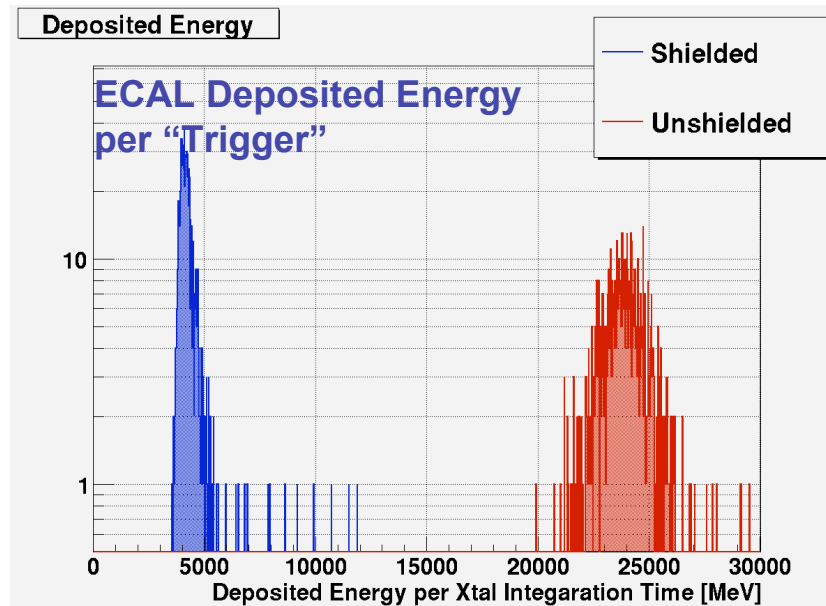

Background Studies

- Data:
 - 0.929 ms of Radiative Bhabha background (Full Simulation)
 - Shielded - Unshielded comparison
 - Delta_Emin comparison
 - 1 Bunch crossing every 4.644 ns
- Deposited energy
 - Bunch crossing
 - Crystal integration time
 - 1 us Csl
 - 0.2us LSO
 - Energy deposit scaled as $(1 - e^{-\Delta t/\tau}) / (1 - e^{-\text{gate}/\tau})$
 - Clustering
- Particles Flux

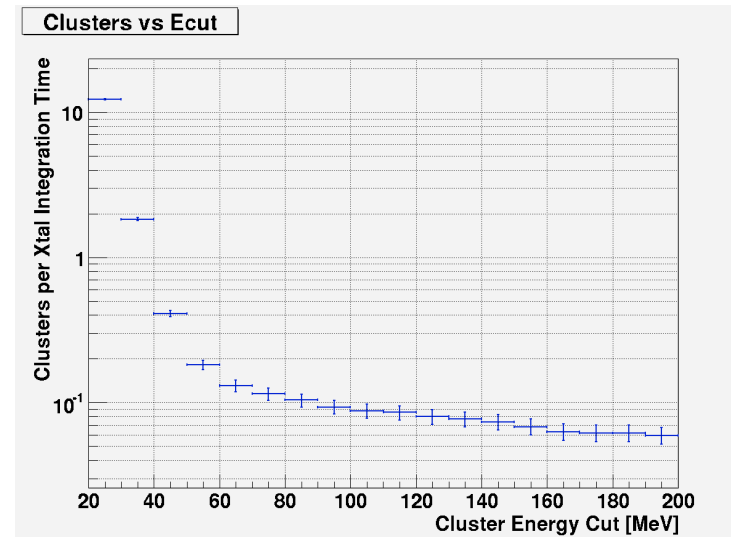

Shielded - Unshielded

Clusters

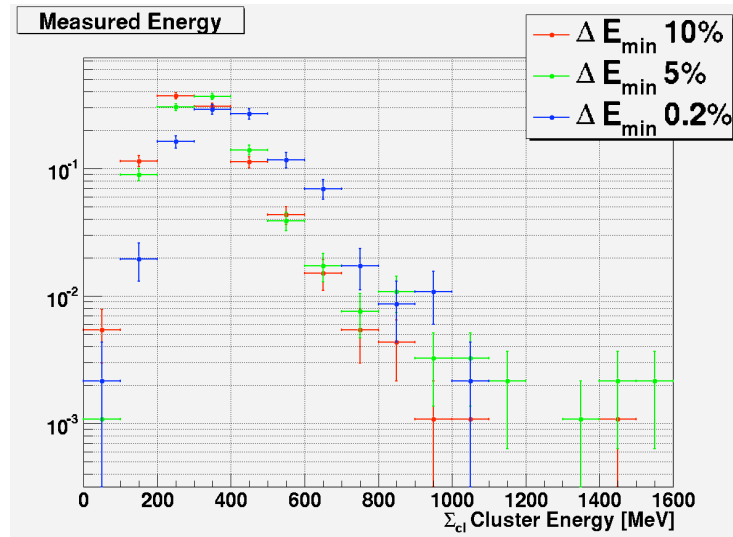

Delat Emin : Crystal Integration time

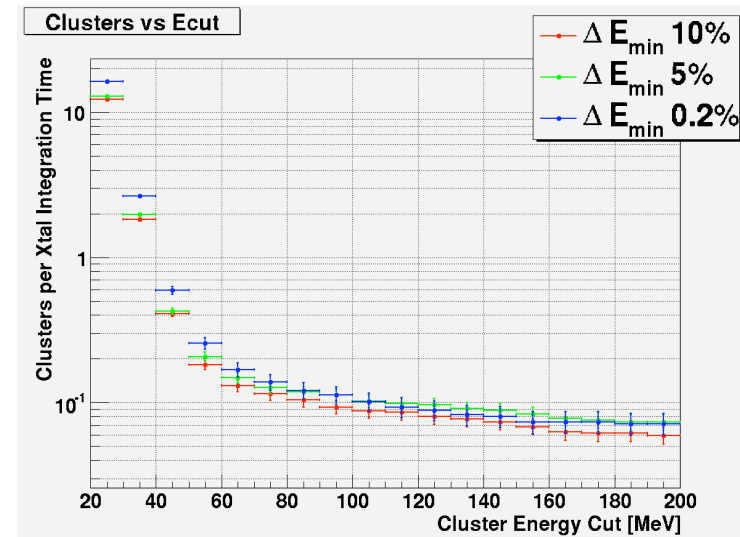

Delta Emin : Clusters

- There is a significant difference between the 10% and 0.2% cuts
- Need to check what happens at lower cut energies

Particles Flux

The simulation tool records infos for all the particles crossing the EMC (and other detectors) volume boundary

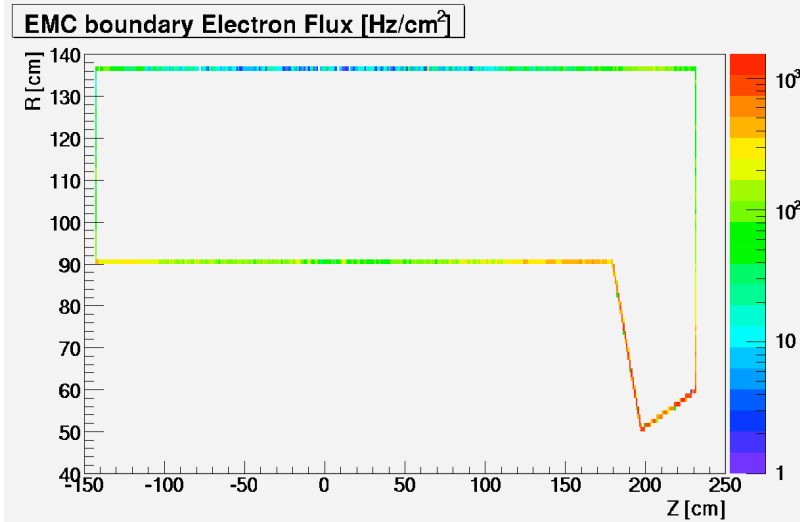

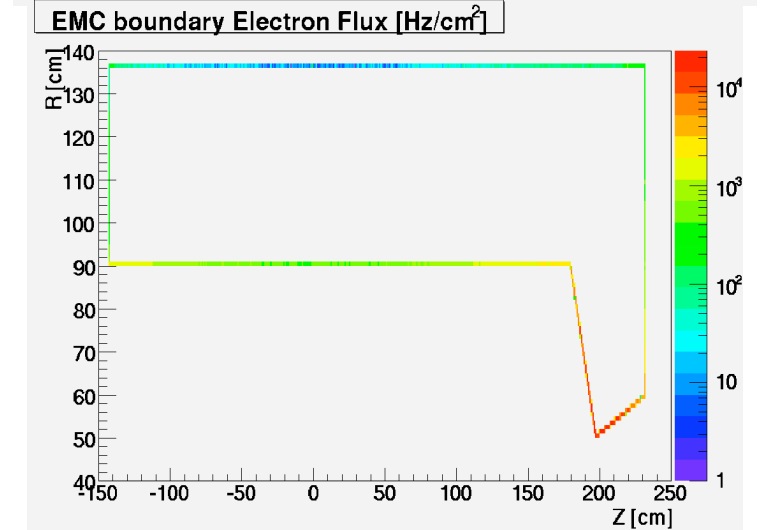

Particles Flux

Shielded

Unshielded

Full Sim - Fast Sim comparison

- Agreement with Chih-hisiang to directly compare Full and Fast simulations
 - Define the same timing windows and energy threshold
 - Use exactly the same set of data
- My analysis still not ready
 - Quick look at fast Sim results may hint that FullSim has larger number of clusters (see Chih-hisiang presentation)

Conclusions

- TB module geometry description under way
 - Included within the SuperB Full Sim package (Bruno) in order to have a direct check of ECAL simulation with the TB

- Background
 - Unshielded configuration
 - seems to have too much EM particles in the EMC
 - Shielded configuration
 - Need to check effects with Physics analysis
 - Cross check with Fast Sim under way
 - Need to lower the cut on the Δ_{Emin} parameter
