

Jets and TMD extraction in SIDIS experiments

Ignazio Scimemi

Departamento Física Teórica, Universidad Complutense de Madrid

Abstract:

Jets are well defined QCD objects that present very nice features in terms of stability with respect to non-perturbative strong interaction effects. Their usage for the extraction of TMD in SIDIS experiments may also allow a better precision with respect to usual fragmentation functions' final states. In this talk I will consider recent studies on this issue.
