## Unitarity Constraints in BSM: new results in the 331 Models

Monday, 27 January 2020 15:15 (40 minutes)

We discuss the main features of the scalar sector of a class of BSM models with enlarged gauge symmetry, the so called 331 Models. The theoretical constraints on the scalar potential such as unitarity, perturbativity and boundedness-from-below, are presented. These results are based on a very-recent analysis that is suitable to be used in phenomenological studies for the exotic scenarios predicted by the 331 Models.

Presenter: COSTANTINI, Antonio (Istituto Nazionale di Fisica Nucleare)
