

Transverse polarization of Lambda-hyperons in e^+e^- annihilation processes in a TMD approach

Marco Zaccheddu - Università degli Studi di Cagliari & INFN

In collaboration with: Umberto D'Alesio, Francesco Murgia

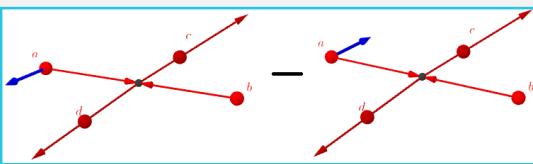

Introduction

Spin and transverse momentum effects expected negligible at high energies.

Single Spin Asymmetry (SSA) at partonic level: $a^{\uparrow}b \rightarrow cd$

$$a_N = \frac{d\sigma^{a^{\uparrow}b \rightarrow cd} - d\sigma^{a^{\downarrow}b \rightarrow cd}}{d\sigma^{a^{\uparrow}b \rightarrow cd} + d\sigma^{a^{\downarrow}b \rightarrow cd}}$$

$$a_N \propto \alpha_s \frac{m}{\sqrt{s}} \simeq \alpha_s \frac{m}{p_{\perp}} \quad [\text{Kane, Pumplin, Repko 1978}]$$

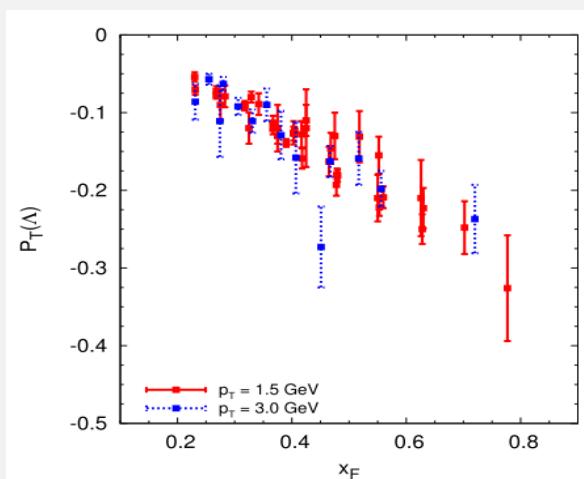

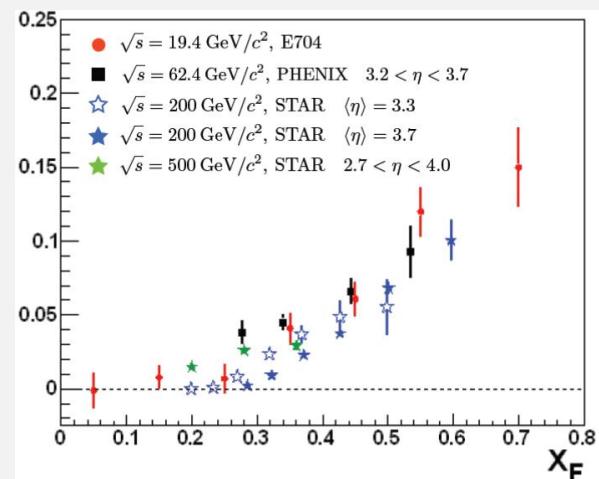

Collinear
pQCD

SSAs at hadronic level:

$$A_N/P_T = \frac{d\sigma^{\uparrow} - d\sigma^{\downarrow}}{d\sigma^{\uparrow} + d\sigma^{\downarrow}} \longrightarrow A_N \leq 1 - 2\%$$

Experimental Data:

$$A_N \simeq 20\% \\ P_T \simeq 30\%$$

TMD factorisation

$$d\sigma^{AB \rightarrow CX} \underset{\text{Hadronic cross sec.}}{\underbrace{\propto}} d\sigma^{ab \rightarrow cd} \underset{\text{Partonic cross sec.}}{\underbrace{\propto}} \left\{ \begin{array}{l} f(x, k_\perp) \text{ TMD PDF} \\ D(z, k_\perp) \text{ TMD FF} \end{array} \right.$$

SSAs closely related to our understanding of:

- Strong interaction/confinement
- Inner structure of hadron in terms of quarks and gluons
- Hadronisation processes

Correlation between intrinsic transverse momenta and spin,
leading to a generalisation of PDFs and FFs,
with asymmetric azimuthal distributions.

New Data in e^+e^- from Belle: 150 data points

Observation of Transverse $\Lambda/\bar{\Lambda}$ Hyperon Polarization in e^+e^- Annihilation at Belle

We report the first observation of the spontaneous polarization of Λ and $\bar{\Lambda}$ hyperons transverse to the production plane in e^+e^- annihilation, which is attributed to the effect arising from a polarizing fragmentation function. For inclusive $\Lambda/\bar{\Lambda}$ production, we also report results with subtracted feed-down contributions from Σ^0 and charm. This measurement uses a dataset of 800.4 fb^{-1} collected by the Belle experiment at or near a center-of-mass energy of 10.58 GeV . We observe a significant polarization that rises with the fractional energy carried by the $\Lambda/\bar{\Lambda}$ hyperon.

T	$\Delta^N D_{h/q^\uparrow}$	$\Delta \hat{D}_{S_Z/s_T}^{h/q}$	$\Delta \hat{D}_{S_X/s_T}^{h/q}$	$\Delta^- \hat{D}_{S_Y/s_T}^{h/q}$

$$e^+ e^- \rightarrow h_1^\dagger h_2 X$$

Helicity matrices

$$\rho_{\lambda_{h_1}, \lambda'_{h_1}}^{h_1, S_{h_1}} \rho_{\lambda_{h_2}, \lambda'_{h_2}}^{h_2, S_{h_2}} \frac{d\sigma^{e^+ e^- \rightarrow h_1 h_2 X}}{d\cos\theta dz_1 d^2\mathbf{p}_{\perp h_1} dz_2 d^2\mathbf{p}_{\perp h_2}}$$

$$= \sum_{q_c} \sum_{\{\lambda\}} \frac{3}{32\pi s} \frac{1}{4} \underbrace{M_{\lambda_c \lambda_d, \lambda_a \lambda_b} M_{\lambda'_c \lambda'_d, \lambda_a \lambda_b}^*}_{\text{Scattering Amplitudes}} \underbrace{\hat{D}_{\lambda_c, \lambda'_c}^{\lambda_{h_1}, \lambda'_{h_1}}(z_1, \mathbf{p}_{\perp h_1}) \hat{O}_{\lambda_d, \lambda'_d}^{\lambda_{h_2}, \lambda'_{h_2}}(z_2, \mathbf{p}_{\perp h_2})}_{\text{TMD Fragmentation Functions}}$$

Polarisation along the hadron helicity axes:

$$\hat{X}_{h_1} = \hat{Y}_{h_1} \times \hat{Z}_{h_1}$$

$$\hat{Y}_{h_1} = \frac{\hat{q}_1 \times P_{h1}}{|\hat{q}_1 \times P_{h1}|}$$

$$\hat{Z}_{h_1} = \frac{P_{h1}}{|P_{h1}|}$$

Polarisation vector

$$\mathcal{P}^{h_1} = P_x^{h_1} \hat{X}_1 + P_y^{h_1} \hat{Y}_1 + P_z^{h_1} \hat{Z}_1$$

Advantages:

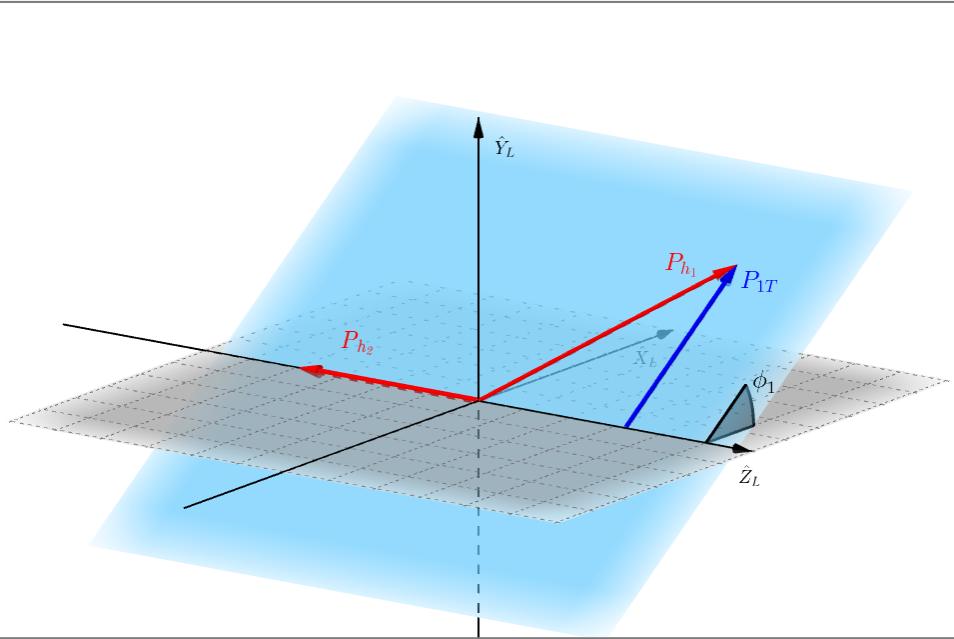

- hadron 2 allows to weight the FF of hadron 1 from (anti)quark 1 ;

Example:

- $h1 : \Lambda(u,d,s) - h2: \pi^+(u,\bar{d})$;
Enhancement of Λ from d quark (at moderate z)

Polarisation: $e^+e^- \rightarrow h_1^\uparrow h_2 X$

Experimental configuration:

- Polarisation measured perpendicularly to the plane of the 2 hadrons
- Matching between theory and experiment
- Data depends only on Energy Fraction z

The polarisation is measured along:

$$\hat{n} = -\hat{P}_{h_2} \times \hat{P}_{h_1}$$

The polarisation projection along \hat{n} :

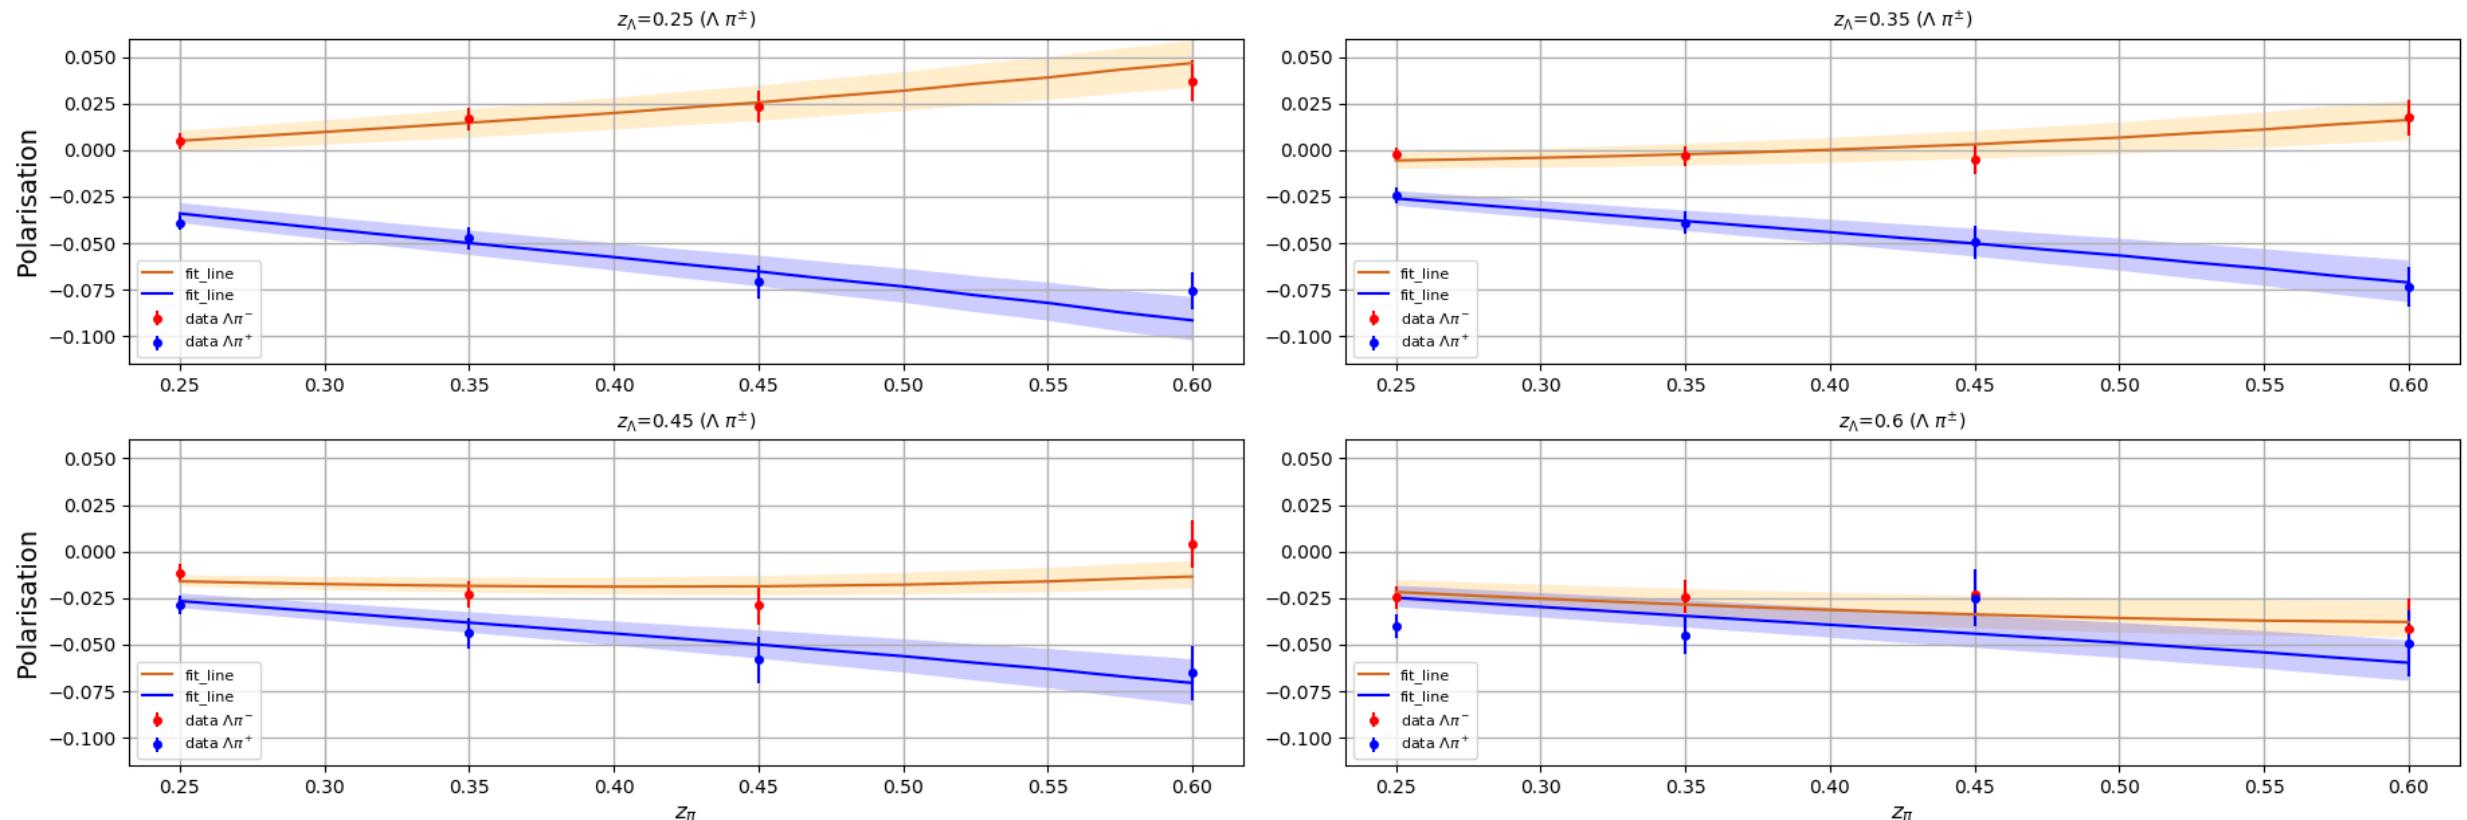

$$\mathcal{P}^{h_1} \cdot \hat{n} = P_x^{h_1} \cos \tilde{\phi} + P_y^{h_1} \sin \tilde{\phi}$$

This projection depends *deeply* on the kinematical variables

$$\begin{aligned} P^{h_1} \cdot \hat{n} :: & \frac{\sum_q \Delta D_{S_Y/q}^h(z) D_{h_2/\bar{q}}(z_2)}{\sum_q D_{h_1/q}(z_1) D_{h_2/\bar{q}}(z_2)} \\ & \times \frac{\sqrt{2e\pi}}{2M_p} \frac{\langle p_\perp^2 \rangle_p^2}{\langle p_\perp^2 \rangle_1} \frac{z_2}{\sqrt{z_1^2 \langle p_\perp^2 \rangle_2 + z_2^2 \langle p_\perp^2 \rangle_p}} \end{aligned}$$

Fit: Lambda-pion

Fit Lambda-hadron $\chi^2/dof = 1.3$

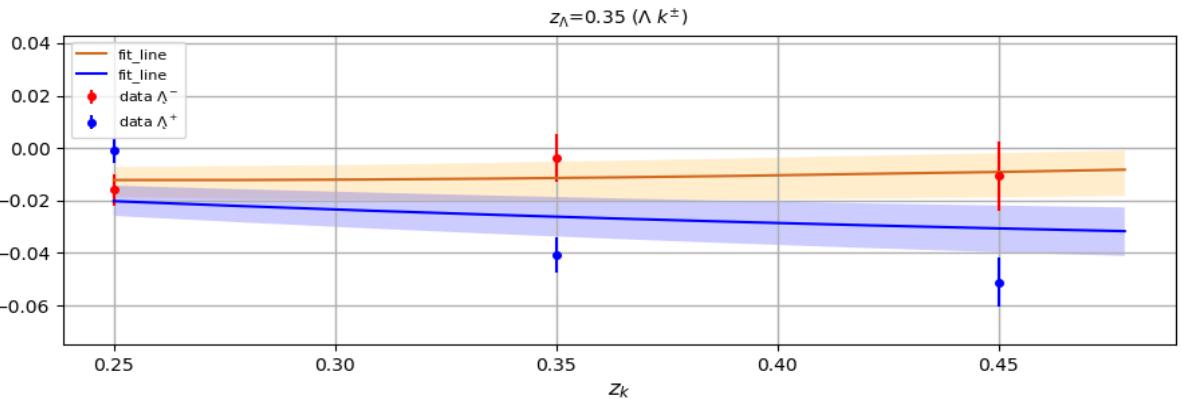

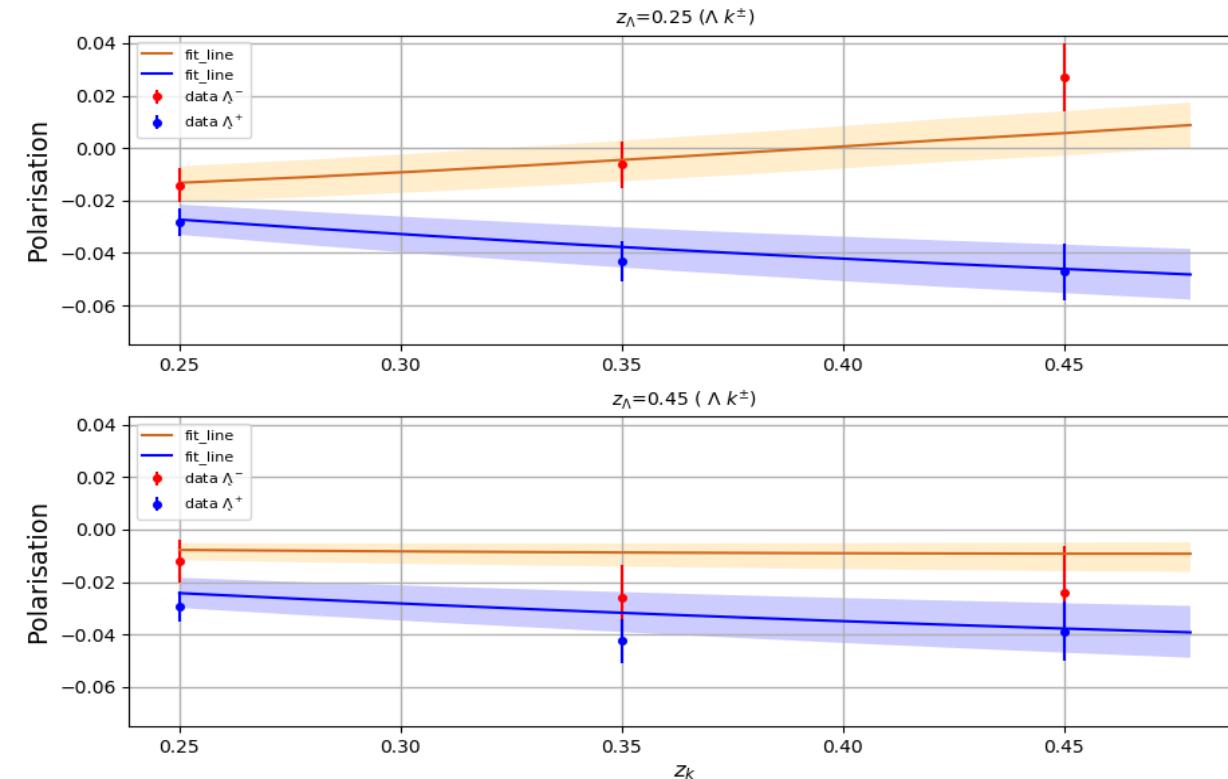

- Red line : $\Lambda\pi^-$
- Blue line : $\Lambda\pi^+$

z_Λ bins : (0.25,0.35,0.45,0.6)

Preliminary

Fit: Lambda-kaon

Fit Lambda-hadron $\chi^2/dof = 1.3$

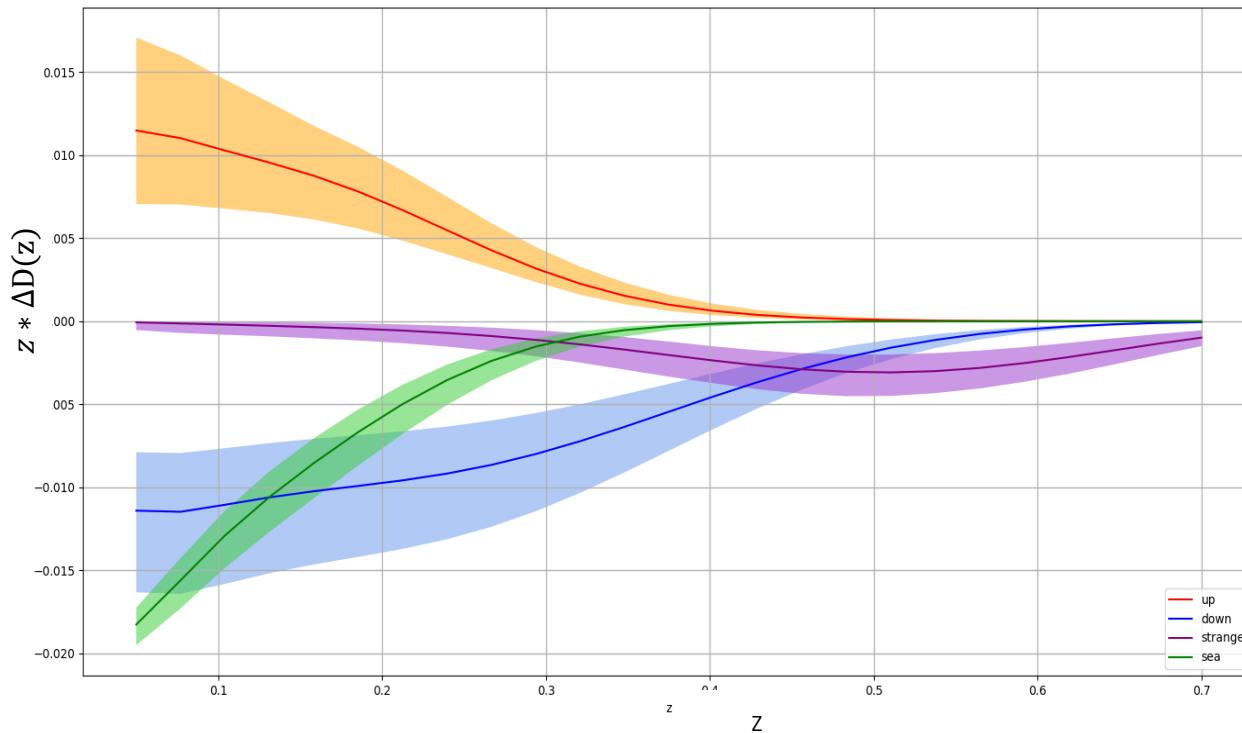

- Red line : ΛK^-
- Blue line : ΛK^+

z_Λ bins : (0.25,0.35,0.45)

Preliminary

Polarising FFs

Polarising FF: $z^* \Delta D(z) = z^* N(z) D(z)$

- Up
- Down
- Strange
- Sea

Preliminary

up vs. down:

- different normalisation and shape (improve the fit)
- Relative opposite sign
- Comparable size at intermediate z
- Faster decrease of up w.r.t down at large z (cancellation vs. role of electric charges)

strange

- dominant at large z
- small at low z

sea

- Large at small z

Conclusions

- Complete helicity formalism within a TMD approach for $e^+e^- \rightarrow h_1(\text{jet})X$ and $e^+e^- \rightarrow h^\dagger_1 h_2 X$
- First extraction of Lambda Polarising FF from Belle data : D'Alesio, Murgia, Zaccheddu

Outlook

- Different Gaussian width for the unpolarised and/or the polarising FF:
z dependence, flavour dependence.
- Functional form of the polarising FF

Grazie

&= \frac{3e^4 e_q^2}{64\pi\hat{s}} \Delta D_{S_Z/s_T}^{h_1}(z_1, p_{\perp 1}) \Delta^N D_{h_2/\bar{q}^\uparrow}(z_2, p_{\perp 2}) \sin^2\theta \sin(2\varphi_2 + \phi_1^{h_1})
\end{aligned}$$

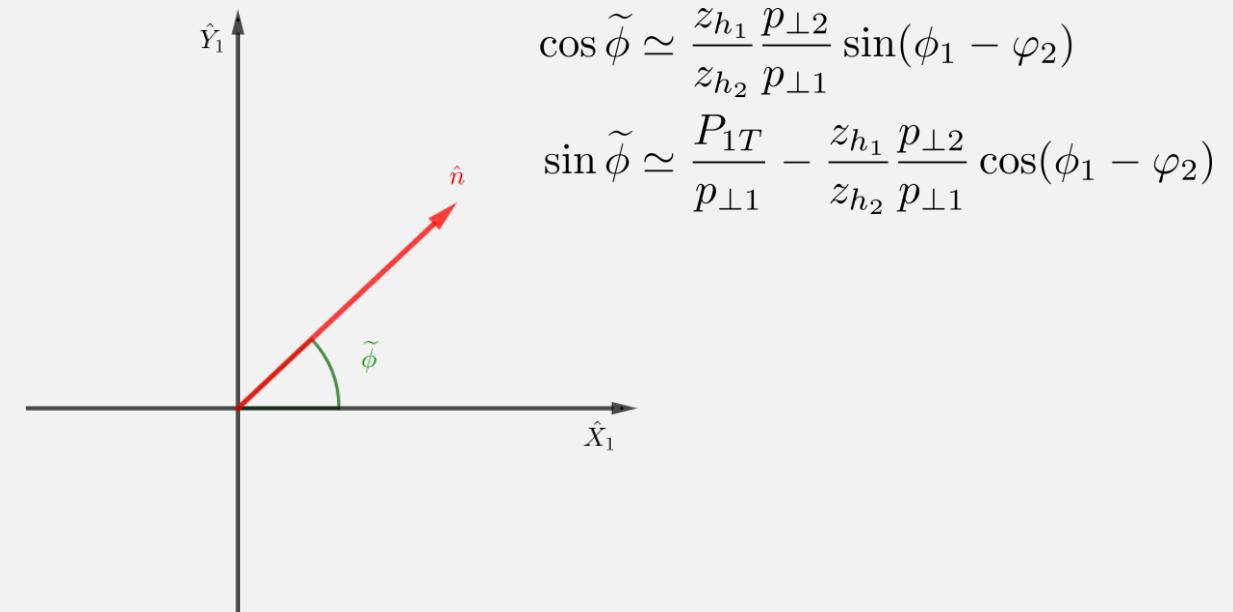

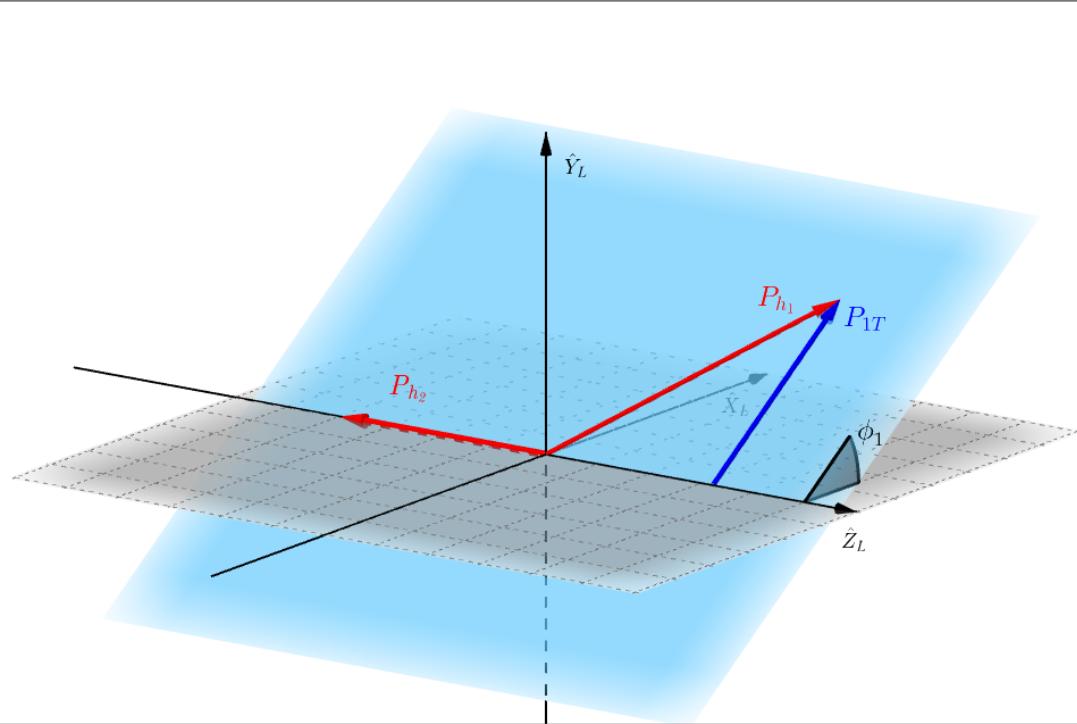

The polarisation is measured along:

$$\hat{n} = -\hat{P}_{h_2} \times \hat{P}_{h_1}$$

Exp. Data depend only on energy fraction z_1, z_2

The polarisation projection along \hat{n} :

$$\mathcal{P}^{h_1} \cdot \hat{n} = P_x^{h_1} \cos \tilde{\phi} + P_y^{h_1} \sin \tilde{\phi}$$

$$\begin{cases} P_1 = \left(P_{1T} \cos \phi_1, P_{1T} \sin \phi_1, P_{1L} \right) \\ p_{\perp 1}^2 \simeq P_{1T}^2 + \left(\frac{z_1}{z_2} \right)^2 p_{\perp 2}^2 - 2 \frac{z_1}{z_2} P_{1T} p_{\perp 2} \cos(\phi_1 - \varphi_2) \end{cases}$$

Phenomenology

From data we can extract different information, particularly:

- $\Lambda(jet)X$: Lambda polarising width $\langle p_\perp^2 \rangle_p$
- $\Lambda\pi X$: Polarising FF (u,d)
- $\Lambda k X$: Polarising FF (u,s)

Fitted parameters:

Flav.	\mathcal{N}_q^p	α_q	β_q	$\langle p_\perp^2 \rangle_p$
u	\mathcal{N}_u^p			
d	\mathcal{N}_d^p			
s	\mathcal{N}_s^p	α_s		$\langle p_\perp^2 \rangle_p$
sea	\mathcal{N}_{sea}^p		β_{sea}	

Polarising parametrization:

$$\Delta D_{S_Y/q}^h(z) = \mathcal{N}_q^p(z) D_{h/q}(z)$$

$$\mathcal{N}_q^p(z) = \mathcal{N}_q^p z^{\alpha_q} (1-z)^{\beta_q} \frac{(\alpha_q + \beta_q)^{(\alpha_q + \beta_q)}}{\alpha_q^{\alpha_q} \beta_q^{\beta_q}}$$

Since we did not have a set of FF that separates the Λ and $\bar{\Lambda}$:

$$D_q^\Lambda = D_q^{\Lambda^0} + D_{\bar{q}}^{\bar{\Lambda}^0} \longrightarrow D_q^\Lambda = D_q^{\Lambda^0} + D_{\bar{q}}^{\Lambda^0}$$

$$D_{\bar{q}}^{\Lambda^0} = (1-z)^\alpha D_q^{\Lambda^0}$$

$$D_q^{\Lambda^0} = \frac{1}{1 + (1-z)^\alpha} D_q^\Lambda \quad \alpha = 1, 2$$

$$D_{\bar{q}}^{\Lambda^0} = \frac{(1-z)^\alpha}{1 + (1-z)^\alpha} D_q^\Lambda$$

FF properties

$$\begin{aligned}
 \hat{D}_{h/q}(z, \mathbf{k}_{\perp}, h) &= D_{h/q} = (D_{++}^{++} + D_{--}^{++}) \\
 \bar{\hat{D}}_{h/q, s_T}(z, \mathbf{k}_{\perp}, h) &= \hat{D}_{h/q} + \frac{1}{2} \Delta \hat{D}_{h/q, s_T} \\
 \Delta \hat{D}_{h/q, s_T}(z, \mathbf{k}_{\perp}, h) &= \Delta^N D_{h/q \uparrow} \sin(\phi_{s_q} - \phi_h) = 4 \text{Im} D_{+-}^{++} \sin(\phi_{s_q} - \phi_h) \quad [\text{Collins}] \\
 \Delta \hat{D}_{S_Z/s_L}^{h/q}(z, \mathbf{k}_{\perp}, h) &= \Delta D_{S_Z/s_L}^{h/q} = (D_{++}^{++} - D_{--}^{++}) \\
 \Delta \hat{D}_{S_Z/s_T}^{h/q}(z, \mathbf{k}_{\perp}, h) &= \Delta D_{S_Z/s_T}^{h/q} \cos(\phi_{s_q} - \phi_h) = 2 \text{Re} D_{+-}^{++} \cos(\phi_{s_q} - \phi_h) \\

 \Delta \hat{D}_{S_X/s_T}^{h/q}(z, \mathbf{k}_{\perp}, h) &= \Delta D_{S_X/s_T}^{h/q} \cos(\phi_{s_q} - \phi_h) = (D_{+-}^{+-} + D_{-+}^{+-}) \cos(\phi_{s_q} - \phi_h) \\
 \Delta \hat{D}_{S_Y/q}^h(z, \mathbf{k}_{\perp}, h) &= \Delta D_{S_Y/q}^h = -2 \text{Im} D_{++}^{+-} \quad [\text{Polarizing}] \\
 \Delta \hat{D}_{S_Y/s_T}^{h/q}(z, \mathbf{k}_{\perp}, h) &= \Delta \hat{D}_{S_Y/c}^{h/q} + \Delta^- \hat{D}_{S_Y/s_T}^{h/q} \\
 \Delta^- \hat{D}_{S_Y/s_T}^{h/q}(z, \mathbf{k}_{\perp}, h) &= \Delta^- D_{S_Y/s_T}^{h/q} \sin(\phi_{s_q} - \phi_h) = (D_{+-}^{+-} - D_{-+}^{+-}) \sin(\phi_{s_q} - \phi_h)
 \end{aligned}$$

$$\begin{aligned}
 D_{++}^{++} &= D_{--}^{--} \\
 D_{--}^{++} &= D_{++}^{--} \\
 D_{+-}^{++} &= -D_{-+}^{--} \\
 D_{-+}^{++} &= -D_{+-}^{--} \\
 D_{++}^{+-} &= -D_{--}^{-+} \\
 D_{++}^{-+} &= -D_{--}^{+-} \\
 D_{+-}^{+-} &= D_{-+}^{-+} \\
 D_{-+}^{+-} &= D_{+-}^{-+} \\
 D_{++}^{+-} &= (D_{-+}^{++})^* \\
 D_{++}^{-+} &= (D_{+-}^{++})^*
 \end{aligned}$$

$$P_T \cdot \hat{n} = P_X^{h_1} \cos \tilde{\phi} + P_Y^{h_1} \sin \tilde{\phi}$$

Polarisation: $e^+e^- \rightarrow h^\uparrow_1 h_2 X$

Experimental data depend only on energy fractions, z :

We introduce for the FF the following parametrisations:

$$\Delta D_{SY/q}^h(z, p_\perp) = \underbrace{\Delta D_{SY/q}^h(z)}_{z \text{ dependence}} \sqrt{2e} \frac{p_\perp}{M_p} \frac{e^{-p_\perp^2/\langle p_\perp^2 \rangle_p}}{\pi \langle p_\perp^2 \rangle_h}$$

$$D_{h/q}(z, p_\perp) = \overline{D_{h/q}(z)} \frac{e^{-p_\perp^2/\langle p_\perp^2 \rangle_h}}{\pi \langle p_\perp^2 \rangle_h} \quad \frac{1}{\langle p_\perp^2 \rangle_p} = \frac{1}{M_p^2} + \frac{1}{\langle p_\perp^2 \rangle_h}$$

Data depends only on Energy Fraction z

The polarisation is measured along:

$$\hat{n} = -\hat{P}_{h_2} \times \hat{P}_{h_1}$$

The polarisation projection along \hat{n} :

$$\mathcal{P}^{h_1} \cdot \hat{n} = P_x^{h_1} \cos \tilde{\phi} + P_y^{h_1} \sin \tilde{\phi}$$

$$P^{h_1} \cdot \hat{n} :: \frac{\sum_q \Delta D_{SY/q}^h(z) D_{h_2/\bar{q}}(z_2)}{\sum_q D_{h_1/q}(z_1) D_{h_2/\bar{q}}(z_2)}$$

$$\times \frac{\sqrt{2e\pi}}{2M_p} \frac{\langle p_\perp^2 \rangle_p^2}{\langle p_\perp^2 \rangle_1} \frac{z_2}{\sqrt{z_1^2 \langle p_\perp^2 \rangle_2 + z_2^2 \langle p_\perp^2 \rangle_p}}$$

Phenomenology and Fit

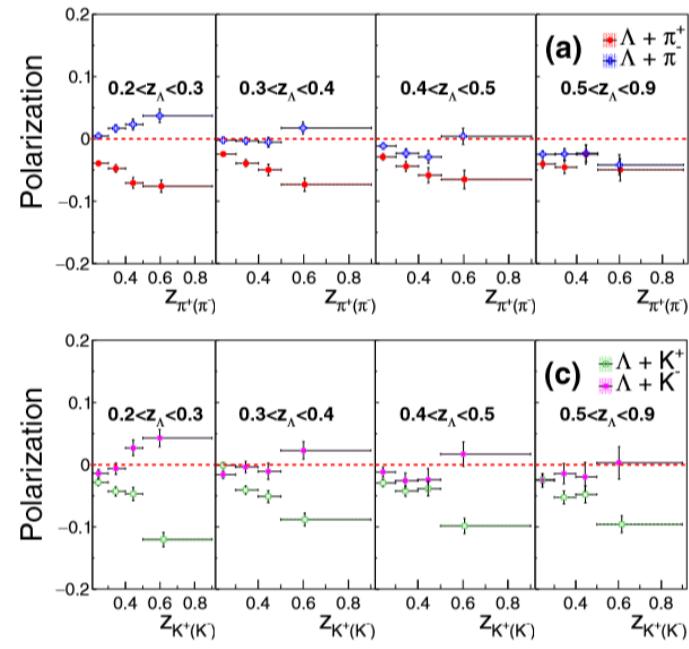

Polarising parametrization:

$$\Delta D_{SY/q}^h(z) = \mathcal{N}_q^p(z) \overbrace{D_{h/q}(z)}^{\text{Unpolarized FF}}$$

$$\mathcal{N}_q^p(z) = \mathcal{N}_q^p z^{\alpha_q} (1-z)^{\beta_q} \frac{(\alpha_q + \beta_q)^{(\alpha_q + \beta_q)}}{\alpha_q^{\alpha_q} \beta_q^{\beta_q}}$$

- Normalisation factor: \mathcal{N}_q^p , $|\mathcal{N}_q^p| \leq 1$
- Shape for high and low z : α_q β_q

Preliminary

- Data selection to Fit:
- Lambda-hadron
 - 100 data points

- $\Lambda(u,d,s) (+ h)$
- $h = \pi(u,d)$
- $h = K(u,s)$
