

# Quantum Technologies within INFN: status and perspectives

## Report of Abstracts

Abstract ID : 53

## The SECRET project

### Content

One popular way to realize quantum communication protocols is through energy-time entanglement (and its synchronized version, called time-bin), since it is robust to environmental disturbances during optical fiber propagation. However, most experiments based on this type of entanglement have an inherent flaw, called the post-selection loophole, which compromises security unless extra assumptions are taken. The members of the SECRET consortium have considerable experience in proposing and realising schemes of entanglement demonstration without the post-selection loophole. The aim of SECRET is to move post-selection loophole-free energy-time/time-bin entanglement towards practical applications such as quantum cryptography, as well as aim towards the building blocks of the Quantum Internet, such as quantum relays.

**Primary authors:** VALLONE, Giuseppe (PD); Prof. VILLORESI, Paolo (Università and INFN Padova)

**Presenter:** VALLONE, Giuseppe (PD)

**Track Classification:** Succesful initiatives within INFN

**Contribution Type:** Invited talk "succesful initiative within INFN"

**Status:** SUBMITTED

Submitted by **VALLONE, Giuseppe** on **Thursday 09 January 2020**
