# Outline

- Motivation
- Stencils and Improvement
  - Laplacian operator
  - Dirac operator
- Eigenvalue spectra
- Tests in quenched QCD
  - Computational cost
  - Physical observables
- Summary / Outlook

# Motivation

$$D(x, y) = \sum_{\mu} \gamma_{\mu} \nabla_{\mu}(x, y) - \frac{1}{2} \Delta(x, y) + m_0$$

Can one do better in discretizing the **first-derivative** and **Laplacian** terms?

- Perfect Actions (Hasenfratz, Niedermayer, etc.)
  - Very expensive computationally
- Truncation (Gattringer, etc.)
  - Tunable parameters for each  $\beta$ ,  $\kappa$  etc.
- Our approach
  - Consider effect on rotational symmetry
  - Consider EV spectrum

## 2D Case - Laplacian

“Standard” stencil

$$\begin{bmatrix} 0 & 1 & 0 \\ 1 & -4 & 1 \\ 0 & 1 & 0 \end{bmatrix} / 4$$

$$\Delta_s = 2 \cos(k_1) + 2 \cos(k_2) - 4$$

“Tilted” stencil

$$\begin{bmatrix} 1 & 0 & 1 \\ 0 & -4 & 0 \\ 1 & 0 & 1 \end{bmatrix} / 2$$

$$\Delta_t = 2 \cos(k_1) \cos(k_2) - 2$$

Combine in the form:  $\alpha \Delta_s + (1 - \alpha) \Delta_t$

## 2D Case - Laplacian

$$\text{Improved Laplacian: } \alpha \Delta_s + (1 - \alpha) \Delta_t$$

$\alpha = 1/2$  “Brillouin” stencil

$$\begin{array}{|c|c|c|} \hline 1 & 2 & 1 \\ \hline 2 & -12 & 2 \\ \hline 1 & 2 & 1 \\ \hline \end{array} /4$$

- Same “lift” for all doublers

$\alpha = 2/3$  “Isotropic” stencil

$$\begin{array}{|c|c|c|} \hline 1 & 4 & 1 \\ \hline 4 & -20 & 4 \\ \hline 1 & 4 & 1 \\ \hline \end{array} /6$$

- Isotropic around origin

## 2D Case - First derivative

Standard derivative in  $x$ :

$$\begin{bmatrix} 0 & 0 & 0 \\ -1 & 0 & 1 \\ 0 & 0 & 0 \end{bmatrix} / 2$$

“Brillouin” in  $x$

$$\begin{bmatrix} -1 & 0 & 1 \\ -2 & 0 & 2 \\ -1 & 0 & 1 \end{bmatrix} / 8$$

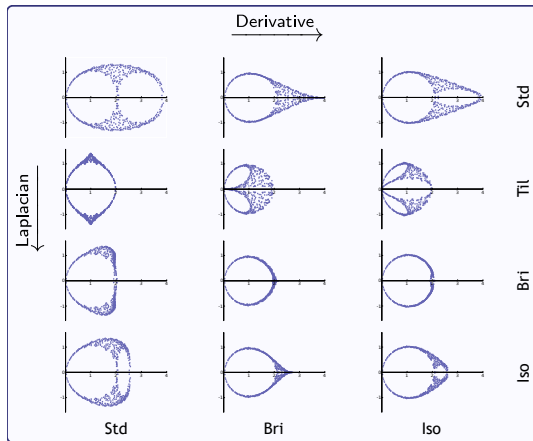

“Isotropic” in  $x$

$$\begin{bmatrix} -1 & 0 & 1 \\ -4 & 0 & 4 \\ -1 & 0 & 1 \end{bmatrix} / 12$$

# 2D Case - Fermion Operator Eigenvalue Spectrum

Operator combinations [U(1),  $16 \times 16$ ,  $\beta = 4.4$ ,  $c_{sw} = 1$ ]

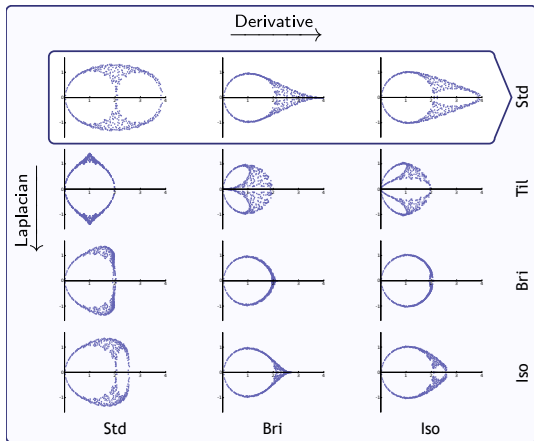

12 Combinations  
3 for derivative  
×  
4 for Laplacian

---

Variation of Laplacian  
most  
significant

# 2D Case - Fermion Operator Eigenvalue Spectrum

Operator combinations [U(1),  $16 \times 16$ ,  $\beta = 4.4$ ,  $c_{sw} = 1$ ]

**Standard Laplacian**

Generally larger C.N.

# 2D Case - Fermion Operator Eigenvalue Spectrum

Operator combinations [U(1),  $16 \times 16$ ,  $\beta = 4.4$ ,  $c_{sw} = 1$ ]

**Tilted Laplacian**  
←  
Remaining doublers

# 2D Case - Fermion Operator Eigenvalue Spectrum

Operator combinations [U(1),  $16 \times 16$ ,  $\beta = 4.4$ ,  $c_{sw} = 1$ ]

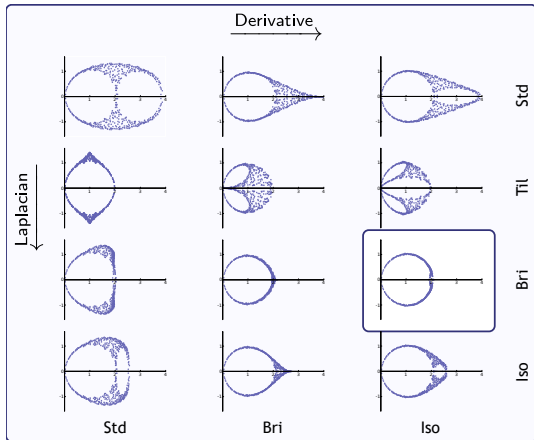

**Bril. & Isotr.  
Laplacians**

Expect better properties  
(C.N., Shifted op,  
rotational symmetry)

# 2D Case - Fermion Operator Eigenvalue Spectrum

Operator combinations [U(1),  $16 \times 16$ ,  $\beta = 4.4$ ,  $c_{sw} = 1$ ]

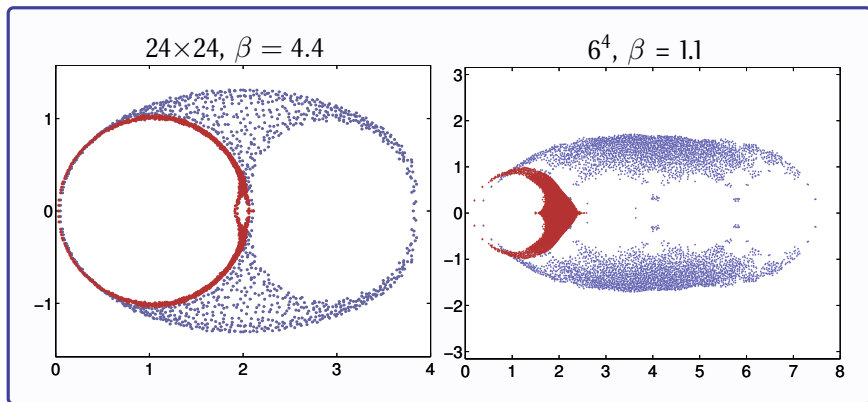

**Bril. Laplacian & Isotr. derivative**

Our choice

The "Beast" operator

# Brillouin Laplacian, Isotropic derivative

- Smaller condition number (especially as Overlap kernel)
- Smaller additive quark mass renormalization  $\Rightarrow$  better chirality
- Expect less rotational symmetry violation
- Good candidate for Overlap kernel

## Practical tests in quenched QCD - Setup

| size             | $\beta$ | a (fm) | $a^{-1}$ (GeV) |
|------------------|---------|--------|----------------|
| $10^3 \times 20$ | 5.72    | 0.160  | 1.236          |
| $12^3 \times 24$ | 5.80    | 0.133  | 1.479          |
| $16^3 \times 32$ | 5.95    | 0.100  | 1.978          |
| $20^3 \times 40$ | 6.08    | 0.080  | 2.463          |
| $24^3 \times 48$ | 6.20    | 0.067  | 2.964          |

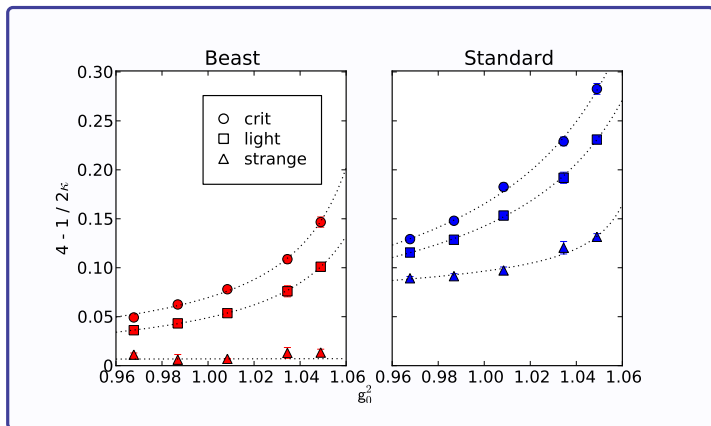

- Constant box size  $L \simeq 1.6$  fm
- One iteration of APE smearing  $\alpha = 0.72$
- $c_{\text{SW}} = 1$  throughout
- Targets:  $r_0 M_{ud}^{\text{PS}} = 1.25$ ,  $r_0 M_{ss}^{\text{PS}} = 2.136$  and  $r_0 M_{cc}^{\text{PS}} = 6.812$   
( $M_\pi = 500$  MeV &  $M_K = 700$  MeV)

## Tuning for $\kappa_{\text{crit}}$

- Linear extrapolation in the range  $(r_0 M_{\text{PS}})^2 \in [1.25^2, 2.136^2]$
- Also done for charm quark

## Determining target $\kappa$

- Rational Ansatz:  $-am_{\text{crit}} = \frac{c_1 g_0^2 + c_2 g_0^4}{1 + c_3 g_0^2}$
- $c_1 = S/(12\pi^2)$ ,  $S$  available for standard Wilson case
- Interpolate for  $\kappa_{\text{light}}$  and  $\kappa_{\text{strange}}$

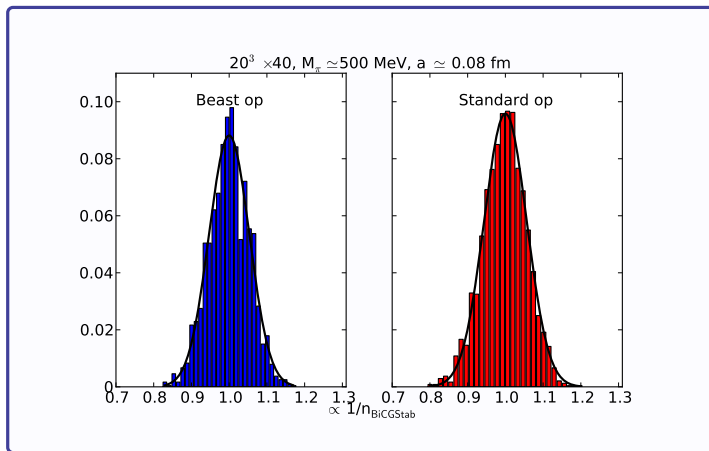

# Pseudoscalar masses

- Consistent masses for all spacings

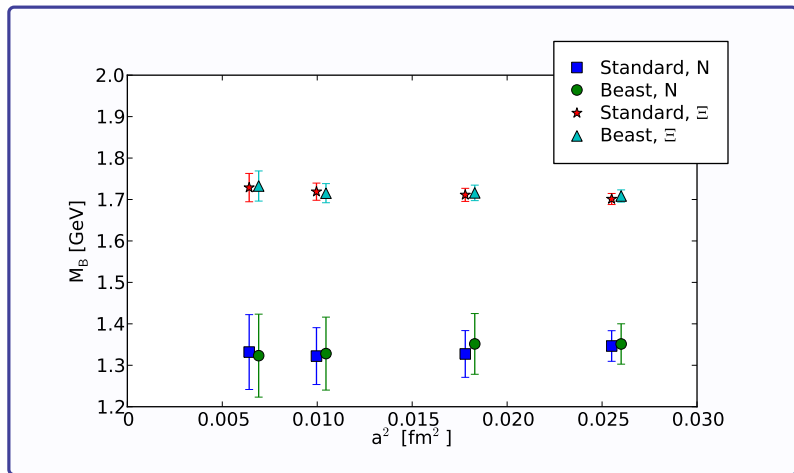

# Inversion Convergence

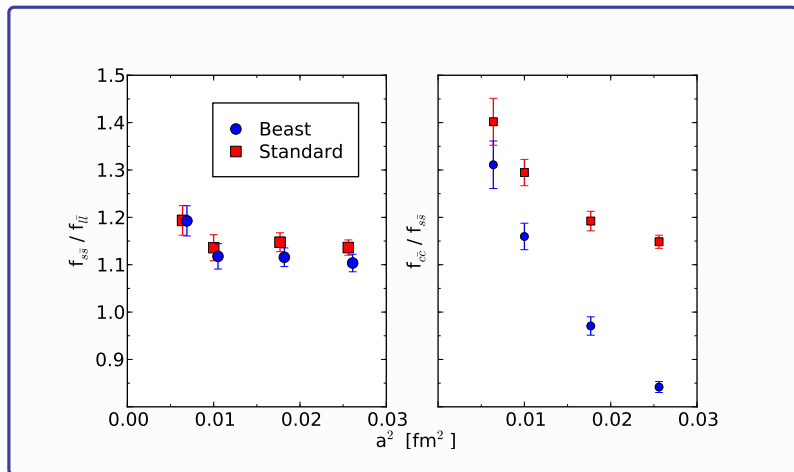

- $\sim 1.7$  less iterations for improved op
- Approx. same width
- Improved operator inversion  $\sim 10$  times more expensive (unoptimized code)

# Nucleon and $\Xi$

- No visible difference for these observables

## Decay constant ratios

- Ratios of decay constants to eliminate  $Z_A$
- Hint of larger scaling region for heavy quarks

# Summary / Outlook

## Summary / Conclusions

- Extended Laplacian and first-derivative operators with no tunable parameters
- Observed reduction of condition number for plain operator
- Carefully tuned  $\kappa_{\text{crit}}$  for various lattice spacings
- Extended scaling region for some observables? – Further analysis required

## Further investigation

- Suitability for Charm physics
- Properties as Overlap kernel

# Correlator distribution

Pseudoscalar correlator at given time - slice

- No significant difference between distributions

# Tuning $\kappa_{\text{charm}}$

# Interpolating for $f_{c\bar{c}}$
