The continuum limit of 2+1 flavor DWF ensembles

Tuesday, 15 June 2010 12:10 (20 minutes)

We present light pseudoscalar physics in the continuum limit of 2+1 flavour domain wall QCD by the RBC and UKQCD collaborations. We make use of a fermion action with good chiral symmetry and use two different lattice spacings. We use a new approach to match ensembles within the range of simulated masses, and apply a simultaneous chiral and continuum extrapolation. We present continuum results for pion and kaon decay constants, f_K/f_pi , quark masses and the neutral kaon mixing parameter B_K . We discuss the systematic errors arising from the choices in the analysis.
