2+1 project - results arriving - talks and posters at LAT10.

## Introduction

The QCD interaction is favour-blind. Neglecting electromagnetic and weak interactions, the only difference between favours comes from the mass matrix. We investigate how favour-blindness constrains hadron masses after favour SU(3) is broken by the mass difference between the strange and light quarks, to help us extrapolate $2+1$ favour lattice data to the physical point.
We have our best theoretical understanding when all 3 quark flavours have the same masses (because we can use the full power of favour $S U(3)$ ); nature presents us with just one instance of the theory, with $m_{s} / m_{l} \approx 25$. We are interested in interpolating between these two cases.

## Introduction

We consider possible behaviours near the symmetric point, and find that favour blindness is particularly helpful if we approach the physical point along a path with $m_{u}+m_{d}+m_{s}$ held constant. We also show that on this trajectory the errors of the partially quenched approximation are much smaller than on other trajectories.

## Strategy

Start from a point with all 3 sea quark masses equal,

$$
m_{u}=m_{d}=m_{s} \equiv m_{0}
$$

and extrapolate towards the physical point, keeping the average sea quark mass

$$
\bar{m} \equiv \frac{1}{3}\left(m_{u}+m_{d}+m_{s}\right)
$$

constant.
Starting point has

$$
m_{0} \approx \frac{1}{3} m_{s}^{p h y s}
$$

As we approach the physical point, the $u$ and $d$ become lighter, but the $s$ becomes heavier. Pions are decreasing in mass, but $K$ and $\eta$ increase in mass as we approach the physical point.

## Quark Masses

Notation

$$
\begin{aligned}
\bar{m} \equiv \frac{1}{3}\left(m_{u}\right. & \left.+m_{d}+m_{s}\right) \\
\hat{m}_{u} & \equiv m_{u}-m_{0} \\
\hat{m}_{d} & \equiv m_{d}-m_{0} \\
\hat{m}_{s} & \equiv m_{s}-m_{0}
\end{aligned}
$$

## Quark Masses

The quark mass matrix is

$$
\begin{aligned}
\mathcal{M} & =\left(\begin{array}{ccc}
m_{u} & 0 & 0 \\
0 & m_{d} & 0 \\
0 & 0 & m_{s}
\end{array}\right) \\
& =\bar{m}\left(\begin{array}{lll}
1 & 0 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1
\end{array}\right)+\frac{1}{2}\left(\hat{m}_{u}-\hat{m}_{d}\right)\left(\begin{array}{ccc}
1 & 0 & 0 \\
0 & -1 & 0 \\
0 & 0 & 0
\end{array}\right)+\frac{1}{2} \hat{m}_{s}\left(\begin{array}{ccc}
-1 & 0 & 0 \\
0 & -1 & 0 \\
0 & 0 & 2
\end{array}\right)
\end{aligned}
$$

$\mathcal{M}$ has a singlet part (proportional to $I$ ) and an octet part, proportional to $\lambda_{3}, \lambda_{8}$. In clover case, the singlet and non-singlet parts of the mass matrix renormalise differently.

## Quark Masses

The quark mass matrix is

$$
\begin{aligned}
\mathcal{M} & =\left(\begin{array}{ccc}
m_{u} & 0 & 0 \\
0 & m_{d} & 0 \\
0 & 0 & m_{s}
\end{array}\right) \\
& =\bar{m}\left(\begin{array}{lll}
1 & 0 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1
\end{array}\right)+\frac{1}{2}\left(\hat{m}_{u}-\hat{m}_{d}\right)\left(\begin{array}{ccc}
1 & 0 & 0 \\
0 & -1 & 0 \\
0 & 0 & 0
\end{array}\right)+\frac{1}{2} \hat{m}_{s}\left(\begin{array}{ccc}
-1 & 0 & 0 \\
0 & -1 & 0 \\
0 & 0 & 2
\end{array}\right)
\end{aligned}
$$

We argue that the theoretically cleanest way to approach the physical point is to keep the singlet part of $\mathcal{M}$ constant, and vary only the non-singlet parts.

## Singlet Quantities

Consider a favour singlet quantity (eg $r_{0}, P$ ) at the symmetric point ( $m_{0}, m_{0}, m_{0}$ ).

$$
\frac{\partial r_{0}}{\partial m_{u}}=\frac{\partial r_{0}}{\partial m_{d}}=\frac{\partial r_{0}}{\partial m_{s}} .
$$

If we keep $m_{u}+m_{d}+m_{s}$ constant, $d m_{s}=-d m_{u}-d m_{d}=-2 d m_{l}$ so

$$
d r_{0}=d m_{u} \frac{\partial r_{0}}{\partial m_{u}}+d m_{d} \frac{\partial r_{0}}{\partial m_{d}}+d m_{s} \frac{\partial r_{0}}{\partial m_{s}}=0
$$

The effect of making the strange quark heavier exactly cancels the effect of making the light quarks lighter, so we know that $r_{0}$ must have a stationary point at the symmetrical point.

## Singlet Quantities

## Singlet Quantities

Any permutation of the quarks

$$
u \leftrightarrow s, \quad u \rightarrow d \rightarrow s \rightarrow u
$$

doesn't really change physics, it just renames the quarks. Any quantity unchanged by all permutations will also be fat at the symmetric point.

## Singlet Quantities

## Singlet Quantities

Permutation sets

## Singlet Quantities

$$
\begin{gathered}
2\left(M_{N}+M_{\Sigma}+M_{\Xi}\right) \\
M_{\Sigma}+M_{\Lambda}
\end{gathered}
$$

## Singlet Quantities

$$
\begin{gathered}
4 M_{K}^{2}+2 M_{\pi}^{2} \\
M_{\pi}^{2}+M_{\eta}^{2}
\end{gathered}
$$

## Singlet Quantities

Use singlets to locate the starting point of our path to physics

$$
\frac{2 M_{K}^{2}+M_{\pi}^{2}}{M_{N}+M_{\Sigma}+M_{\Xi}}=\text { physical value }
$$

## $\mathrm{SU}(3)$ classification

The permutation group yields a lot of useful relationships, but can't capture the entire structure. No connection between $\Delta^{++}$, uuu and $\Delta^{+}$, uud.

## SU(3) classification

- Classify physical quantities by $S U(3)$ and permutation group (which is a subgroup of $\mathrm{SU}(3)$ ).
- Classify quark mass polynomials in same way.
- Taylor expansion about $\left(m_{0}, m_{0}, m_{0}\right)$ strongly constrained by symmetry.

## SU(3) classification

| Polynomial |  | $S_{3}$ |  | $S U(3)$ |
| :---: | :---: | :---: | :---: | :---: |
| 1 | $\checkmark$ | $A_{1}$ | 1 |  |
| $\left(\bar{m}-m_{0}\right)$ |  | $A_{1}$ | 1 |  |
| $\begin{gathered} \hat{m}_{s} \\ \left(\hat{m}_{u}-\hat{m}_{d}\right) \end{gathered}$ | $\begin{aligned} & \checkmark \\ & \checkmark \end{aligned}$ | $\begin{aligned} & E^{+} \\ & E^{-} \end{aligned}$ |  | $\begin{aligned} & 8 \\ & 8 \end{aligned}$ |
| $\begin{gathered} \left(\bar{m}-m_{0}\right)^{2} \\ \left(\bar{m}-m_{0}\right) \hat{m}_{s} \\ \left(\bar{m}-m_{0}\right)\left(\hat{m}_{u}-\hat{m}_{d}\right) \end{gathered}$ |  | $\begin{aligned} & A_{1} \\ & E^{+} \\ & E^{-} \end{aligned}$ | 1 | $\begin{aligned} & 8 \\ & 8 \end{aligned}$ |

## SU(3) classification

## SU(3) classification

## SU(3) classification

The only quantities with a non-zero slope at symmetric point are favour octet quantities.
(only applies on $m_{u}+m_{d}+m_{s}=$ const line.)
Often slopes highly constrained:
Decuplet baryons - 4 particles; but 1 slope parameter.
Octet baryons - 4 particles; but 2 slopes.
Octet mesons - 3 particles; but 1 slope parameter.

## Gell Man Okubo relations

$$
\begin{aligned}
4 M_{\Delta}+3 M_{\Sigma^{*}}+2 M_{\Xi^{*}}+M_{\Omega} & =13.821 \mathrm{GeV} \\
-2 M_{\Delta}+M_{\Xi^{*}}+M_{\Omega} & =0.742 \mathrm{GeV} \\
4 M_{\Delta}-5 M_{\Sigma^{*}}-2 M_{\Xi^{*}}+3 M_{\Omega} & =-0.044 \mathrm{GeV} \\
-M_{\Delta}+3 M_{\Sigma^{*}}-3 M_{\Xi^{*}}+M_{\Omega} & =-0.006 \mathrm{GeV}
\end{aligned}
$$

Hierarchy:

$$
\begin{aligned}
& 1, \quad 8, \quad 27, \quad 64 . \\
& \left(m_{s}-m_{l}\right)^{0}, \quad\left(m_{s}-m_{l}\right)^{1}, \quad\left(m_{s}-m_{l}\right)^{2}, \quad\left(m_{s}-m_{l}\right)^{3}
\end{aligned}
$$

Suggests short Taylor series may work well all the way from symmetry point ( $m_{0}, m_{0}, m_{0}$ ) to physical point.

## Partial Quenching

Partial quenching (making measurements with valence quarks which have masses different from the sea quarks used to generate a configuration) works well along the line $\bar{m}_{\text {sea }}=$ const. The argument is very similar to the one we gave earlier, the effects of making the $u_{\text {sea }}$ and $d_{\text {sea }}$ lighter is largely cancelled by the effect of making the $s_{\text {sea }}$ heavier. The cancellation is perfect at the symmetric point. On our trajectory, the error from partial quenching is quadratic in the quark mass; normally partial quenching errors are linear in $m_{q}$.

## Partial Quenching

Flavour Symmetryand Flavour Symmetry Breakingin $2+1$ flavour lattice simulations - p.26/3

## Partial Quenching

## Partial Quenching

As an example, let us look at the $\Omega$ made with three quarks with $\kappa_{\text {val }}=0.12080$.
We have measured this combination on 4 different backgrounds, 3 with the same value for $\left(m_{u}+m_{d}+m_{s}\right)_{\text {sea }}$, and one lying off the trajectory, with a larger value of $\left(m_{u}+m_{d}+m_{s}\right)_{\text {sea }}$.

| $\kappa_{l}^{\text {sea }}$ | $\kappa_{s}^{\text {sea }}$ | $\kappa^{\text {val }}$ | $a M_{\Omega}$ |  |
| :---: | :---: | :---: | :---: | :---: |
| 0.12100 | 0.12070 | 0.12080 | $0.610(7)$ | PQ |
| 0.12095 | 0.12080 | 0.12080 | $0.605(4)$ | full |
| 0.12090 | 0.12090 | 0.12080 | $0.608(7)$ | PQ |
| 0.12080 | 0.12080 | 0.12080 | $0.642(10)$ | full |

On trajectory, PQ and full results agree, but not off the trajectory.

## Partial Quenching

Partial Quenched mass formulae. $\left(m_{u}+m_{d}+m_{s}\right)_{\text {sea }}$ held constant - no constraint on valence masses.

$$
\hat{\mu}_{f} \equiv m_{f}^{v a l}-m_{0}
$$

Can rotate valence masses independently of sea masses. Sea masses - singlet polynomials.

Constraint: $\Omega$ mass independent of $m_{u}^{v a l}, m_{d}^{v a l}$.
Second order polynomials - singlet coefficients fixed by 8-plet and 27-plet.

## Partial Quenching

Decuplet

$$
\begin{aligned}
& q_{1} q_{2} q_{3} \\
& \hat{\mu}_{1}+\hat{\mu}_{2}+\hat{\mu}_{3}
\end{aligned}
$$

Second order

$$
\begin{gathered}
\hat{\mu}_{1}^{2}+\hat{\mu}_{2}^{2}+\hat{\mu}_{3}^{2} \\
\left(\hat{\mu}_{1}-\hat{\mu}_{2}\right)^{2}+\left(\hat{\mu}_{1}-\hat{\mu}_{3}\right)^{2}+\left(\hat{\mu}_{2}-\hat{\mu}_{3}\right)^{2}
\end{gathered}
$$

(or linear combinations, eg

$$
\hat{\mu}_{1} \hat{\mu}_{2}+\hat{\mu}_{1} \hat{\mu}_{3}+\hat{\mu}_{2} \hat{\mu}_{3}
$$

## Partial Quenching

$$
\begin{aligned}
M_{\Delta}= & M_{0}+3 A \hat{\mu}_{l}+B_{0} \hat{m}_{l}^{2}+3 B_{1} \hat{\mu}_{l}^{2} \\
M_{\Sigma^{*}}= & M_{0}+A\left(2 \hat{\mu}_{l}+\hat{\mu}_{s}\right)+B_{0} \hat{m}_{l}^{2} \\
& +B_{1}\left(2 \hat{\mu}_{l}^{2}+\hat{\mu}_{s}^{2}\right)+B_{2}\left(\hat{\mu}_{s}-\hat{\mu}_{l}\right)^{2} \\
M_{\Xi^{*}}= & M_{0}+A\left(\hat{\mu}_{l}+2 \hat{\mu}_{s}\right)+B_{0} \hat{m}_{l}^{2} \\
& +B_{1}\left(\hat{\mu}_{l}^{2}+2 \hat{\mu}_{s}^{2}\right)+B_{2}\left(\hat{\mu}_{s}-\hat{\mu}_{l}\right)^{2} \\
M_{\Omega}= & M_{0}+3 A \hat{\mu}_{s}+B_{0} \hat{m}_{l}^{2}+3 B_{1} \hat{\mu}_{s}^{2}
\end{aligned}
$$

## Conclusions

- Extrapolating from lattice simulations to the physical quark masses is made much easier by keeping $m_{u}+m_{d}+m_{s}$ constant.
- Flavour SU(3) analysis strongly constrains Taylor expansions in quark masses.
- See next talk for how well the idea works in practice.
