Introduction

Calculations

Results

Work in progress

Conclusions

Rare Kaon decays have not been detected yet:

$$BR(K_L \rightarrow \pi^0 \ell^\pm \ell^\mp)_{exp} < 6.6 \cdot 10^{-10}$$

In the SM they are estimated to be

$$BR(K \rightarrow \pi e e)_{SM} \sim 1.5 \cdot 10^{-12}$$

$$BR(K \rightarrow \pi \mu \mu)_{SM} \sim 3 \cdot 10^{-10}$$

New physics can be the leading contribution, mediated through the Electro-magnetic and Chromo-magnetic operators:

$$\begin{aligned} Q_{EM}^+ &= \bar{s} F_{\mu\nu} \sigma^{\mu\nu} d \\ Q_{CM}^+ &= \bar{s} G_{\mu\nu} \sigma^{\mu\nu} G_{\mu\nu} d \end{aligned}$$

- Sensitive to hadronic matrix elements.

Previous work

Kaon EM
matrix
elements

Baum et al.

First lattice calculation [Becirevic et al. 2001] of the EM form factor

$$f_T(q^2 = 0) = 0.77 \pm 0.06 \pm 0.03$$

With the slope in q^2

$$\lambda = 1.21 \pm 0.05 \text{ GeV}^{-2}$$

- Quenched ($n_f = 0$)
- High pion masses ($530 < m_\pi < 800 \text{ MeV}$)
- One lattice size ($a^{-1} = 2.7(1) \text{ GeV}$)

Introduction

Work in
progress

Conclusions

Lattice details

- ETMC lattice QCD simulations [ETMC 0701012, 0911.5061]
- Dynamical flavors: $n_f = 2$
- Pion mass range: $270 < m_\pi < 600$ MeV
- Lattice sizes: $24^3 \times 48$ and $32^3 \times 64$
- Lattice step sizes: $a = 0.068, 0.085, 0.10$ fm
- Action is Symanzik tree-level improved with maximally twisted-mass Wilson fermions
- Non perturbative renormalization in the RI/MOM scheme [ETMC 1004.1115]
- 3-point correlators with all-to-all stochastic propagator calculation, increase accuracy
- Breit momentum frame: $\vec{p}_K = \vec{p}, \vec{p}_\pi = -\vec{p}$

Electromagnetic form factor calculation

$$Q_{EM} = \bar{s}\sigma^{\mu\nu}d$$

The EM form factor is acquired from the EM matrix element by [Becirevic et al. 2001]:

$$\left\langle \frac{\pi^0}{\sqrt{2}} \left| Q_{EM} \right| K^0 \right\rangle = i (p_K^\mu p_\pi^\nu - p_K^\nu p_\pi^\mu) \frac{\sqrt{2}f_T}{m_K + m_\pi}$$

To obtain the matrix elements from the 3-point correlators, we look at the lattice times far from the pion and Kaon sources

$$C_3^{K\pi} \rightarrow \frac{\sqrt{Z_K Z_\pi}}{4E_K E_\pi} \langle \pi^0 | Q_{EM} | K^0 \rangle e^{-E_K t_x - E_\pi (t_y - t_x)}$$

and use the ratio

$$\frac{C_3^{K\pi} C_3^{\pi K}}{C_2^\pi(t_y) C_2^K(t_y)} \rightarrow \frac{\langle \pi^0 | Q_{EM} | K^0 \rangle^2}{16E_K E_\pi}$$

where t_y is a fixed point $t_y = T/2$.

Calculations

Introduction

Calculations

Results

Work in
progress

Conclusions

- Interpolation in momentum to $q^2 = 0$, assuming pole behaviour:

$$f_T(q^2) = \frac{f_T(0)}{1 - q^2\lambda}$$

- Interpolation to physical strange mass:

$$(2m_K^2 - m_\pi^2)_{LATT} \rightarrow (2m_K^2 - m_\pi^2)_{PHYS} \propto (m_s)_{PHYS}$$

Extrapolation in masses

Pion and
Kaon EM
matrix
elements

Baum et al.

Introduction

Calculations

Results

Work in
progress

Conclusions

Extrapolation in m_π^2 to physical pion mass $m_{\pi 0} = 135$ MeV

- linear $f = Am_\pi^2 + B$
- quadratic $f = A'm_\pi^4 + B'm_\pi^2 + C'$
- log-linear $f = A''m_\pi^2 \ln(m_\pi^2) + B''m_\pi^2 + C''$

- Small finite volume effects

Baum et al.

Introduction

Calculations

Results

Work in
progress

Conclusions

We find (Preliminary results, no systematic effects)

$$f_T(q^2 = 0) = 0.430 \pm 0.066^{stat}$$

$$\lambda = 1.61 \pm 0.41^{stat} \text{ GeV}^{-2} \text{ (slope in } q^2, \text{ pole fit)}$$

To compare with [Becirevic et al. 2001] (linear fit)

$$f_T(0) = 0.77 \pm 0.06 \pm 0.03$$

$$\lambda = 1.21 \pm 0.05 \text{ GeV}^{-2}$$

Baum et al.

Introduction

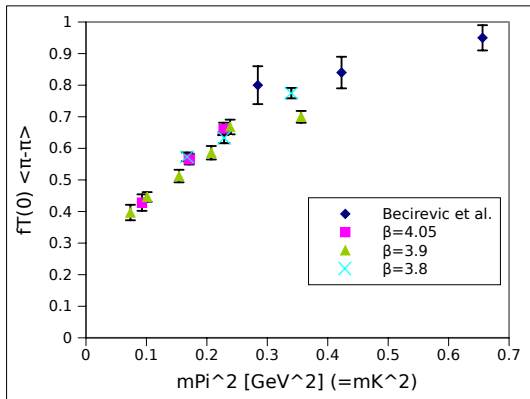

Calculations

Results

Work in
progress

Conclusions

Confronting results for $m_K = m_\pi$ for similar lattice sizes a

Similar behaviour, difference may be due to:

- Extrapolation from large pion masses
- Quenching effects

Work in progress

- Electro-magnetic operator $Q_{EM}^+ = \bar{s}\sigma^{\mu\nu}d$
 - Combined fit for all lattice spacings
 - Systematic errors analysis (chiral extrapolation, momentum dependence)

- Chromo-magnetic operator $Q_{CM}^+ = \bar{s}G_{\mu\nu}\sigma^{\mu\nu}d$
 - No previous lattice calculation
 - Matrix elements calculation
 - Renormalization

$$Q_{CM}^{renorm} = Z_{CM} \left(Q_{CM}^{bare} + \frac{c}{a} Q_S \right)$$

- additive – subtraction of mixing with scalar operator
- multiplicative – 1-loop lattice perturbation theory [H. Panagopoulos et al.]

Conclusions

Introduction

Calculations

Results

Work in
progress

Conclusions

- Previously, single calculation (2001) of the EM operator
- Our calculations were performed for a large range of masses and lattice spacings
- Higher statistical accuracy achieved
- Values at $q^2 = 0$ differ, may be due to either quenching or smaller pion masses
- Slope in q^2 is consistent with previous result, but with higher preliminary statistical error
- Chromo-magnetic operator is work-in-progress
