Forces between static-light mesons

Thursday, 17 June 2010 14:30 (20 minutes)

I report about a computation of the isospin, spin and parity dependent potential between a pair of static-light mesons using Wilson twisted mass lattice QCD with two flavors of degenerate dynamical quarks. From the results a simple rule can be deduced stating, which isospin, spin and parity combinations correspond to attractive and which to repulsive forces.
