## Improved Lattice Spectroscopy of Minimal Walking Technicolor

*Thursday, 17 June 2010 15:30 (20 minutes)*

Lattice studies of theories other than QCD have recently begun to shed light on the conjectured conformal window of Yang-Mills field theories, and whether they can help to form viable models of dynamical electroweak symmetry breaking. Minimal Walking Technicolor has attracted particular attention. We describe recent spectroscopic studies of MWT, searching for signs of near-conformal behaviour and efforts to analyse the systematic difficulties encountered in these studies.
