## Two-photon decay of $\pi^0$ from two-flavor lattice QCD

Thursday, 17 June 2010 16:40 (20 minutes)

We discuss chiral and momentum extrapolation of the transition form factor of  $\pi^0$  to two-photon using one-loop chiral perturbation theory (ChPT). Fitting the lattice data with the ChPT formula obtained for off-shell photons, we estimate low-energy constants that describe mass and momentum dependence of the  $\pi^0$  to two-photon decay, which can be used to estimate the physical  $\pi^0 - > \gamma \gamma$  amplitude.
