The phase-1 upgrade of the ATLAS level-1 calorimeter trigger

Friday, 27 May 2022 15:36 (1 minute)

The ATLAS level-1 calorimeter trigger (L1Calo) is a hardware-based system that identifies events containing calorimeter-based physics objects, including electrons, photons, taus, jets, and missing transverse energy. In preparation for Run 3, when the LHC will run at higher energy and instantaneous luminosity, L1Calo is currently implementing a significant programme of planned upgrades. The existing hardware will be replaced by a new system of FPGA-based feature extractor (FEX) modules, which will process finer-granularity information from the calorimeters and execute more sophisticated algorithms to identify physics objects; these upgrades will permit better performance in a challenging high-luminosity and high-pileup environment. This talk will introduce the features of the upgraded L1Calo system and the current status of installation and commissioning. In addition, the expected performance of L1Calo in Run 3 will be discussed.

Collaboration

The ATLAS Collaboration

Primary authors: HILLIER, Stephen (University of Birmingham); NAKAHAMA, Yu (KEK IPNS)

Presenter: RASSLOFF, Damir (University of Heidelberg)

Session Classification: Front End, Trigger, DAQ and Data Management - Poster session
