Enabling technologies for measurements of short-lived particle dipole moments

Monday, 23 May 2022 11:15 (1 minute)

Magnetic and electric dipole moments of fundamental particles provide powerful probes for physics within and beyond the Standard Model. For the case of short-lived particles, these have not been experimentally accessible to date due to the difficulties imposed by their short lifetimes. The R&D on bent crystals and the experimental techniques developed to enable such measurements are discussed. An experimental test at the insertion region IR3 of the LHC is considered for the next few years as proof of principle of a future fixed-target experiment for the measurement of charm baryon dipole moments. The layout of the experiment, the instrumentation to be developed, and the main goals of the test are also presented.

Collaboration

Primary authors: MARTINEZ-VIDAL, Fernando (IFIC (Universidad de Valencia-CSIC)); NERI, Nicola (University and INFN Milano); REDAELLI, Stefano; FERRO-LUZZI, massimiliano (CERN)

Presenter: NERI, Nicola (University and INFN Milano)

Session Classification: Detector Systems and Future accelerators - Poster session
