

Update on
Tuning MC and DATA for VETO

F. Oliva on behalf of the PADME Lecce group

OUTLINE

- Find best esteem for digi time window MC to emulate the Veto FEE

- Comparison DATA MC

Low Thrs for Reco Chosen

MC Cluster Hit/Seed Thr 0.1 MeV

DATA Cluster Hit/Seed Thr 2.5 mV

Best solution for the future is to convert pulse height in energy released for DATA and set common thresholds

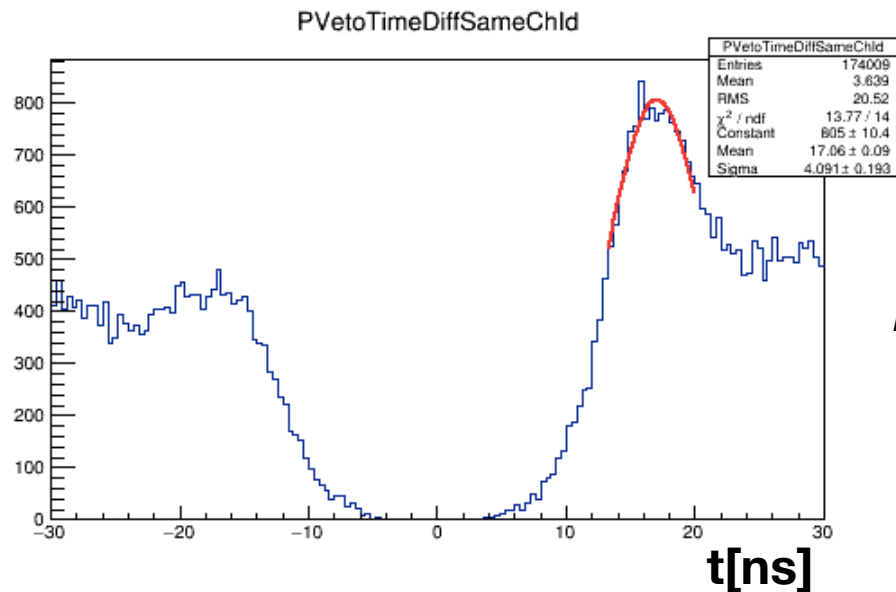

1000 events

MC 23000 POT 250 ns bunch length, BeW, VC on

DATA reference run run_0000000_20190724_152634

Difference between two hits of the same ChId, DATA

Develop Thrs for Reco Peak Search

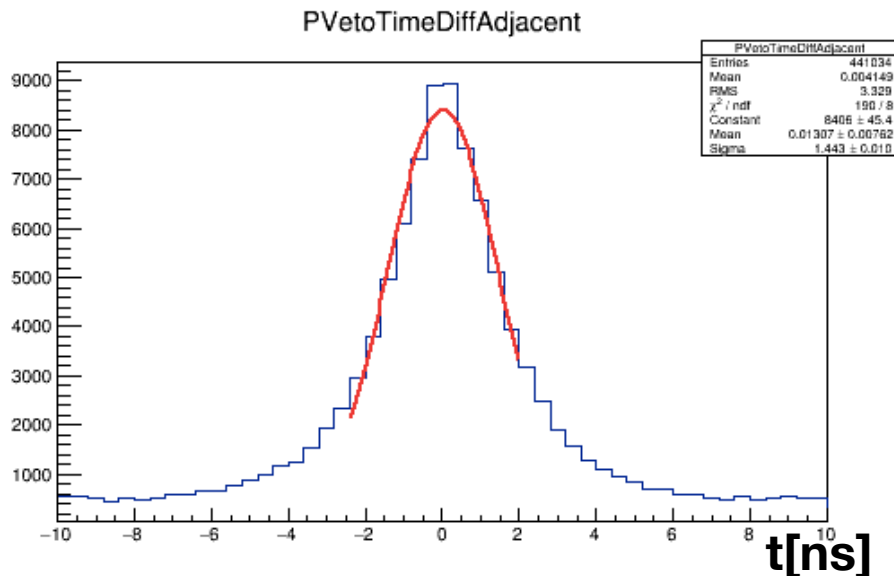

Mean ~17.06 ns

17 ns time digi window chosen for MC

Difference between two hits of two adjacent ChId, DATA

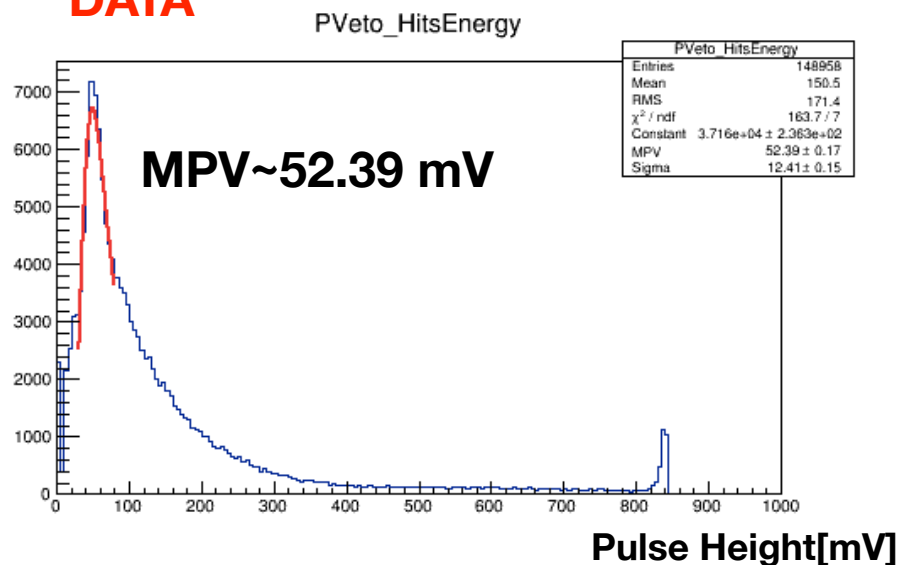

sigma~1.4ns

Delta Cluster Time Chosen 2 ns

Esteem of the conversion factor pulse height-energy

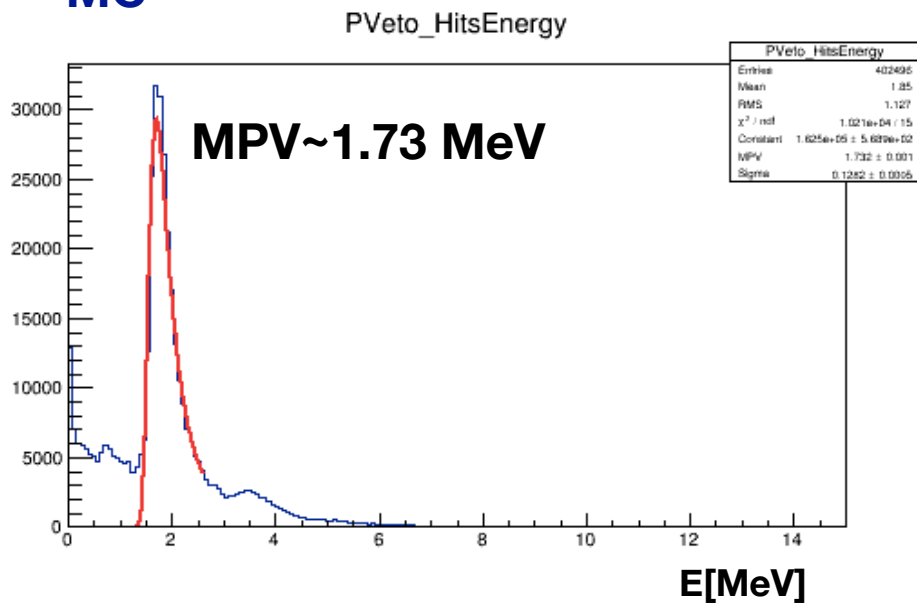

DATA

The energy associated to the hit for DATA corresponds to the pulse height of the signal. For the comparison with the MC a conversion factor is needed.

$$\text{DATA Energy [MeV]} = \text{Pulse Height [mV]} / \text{CF [mV/MeV]}$$

MC

CF=Conversion Factor

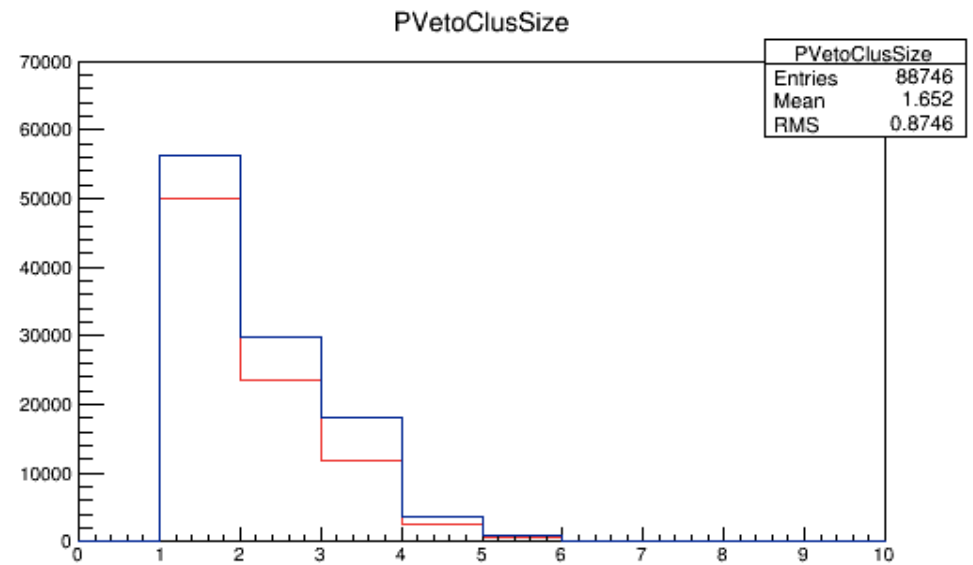

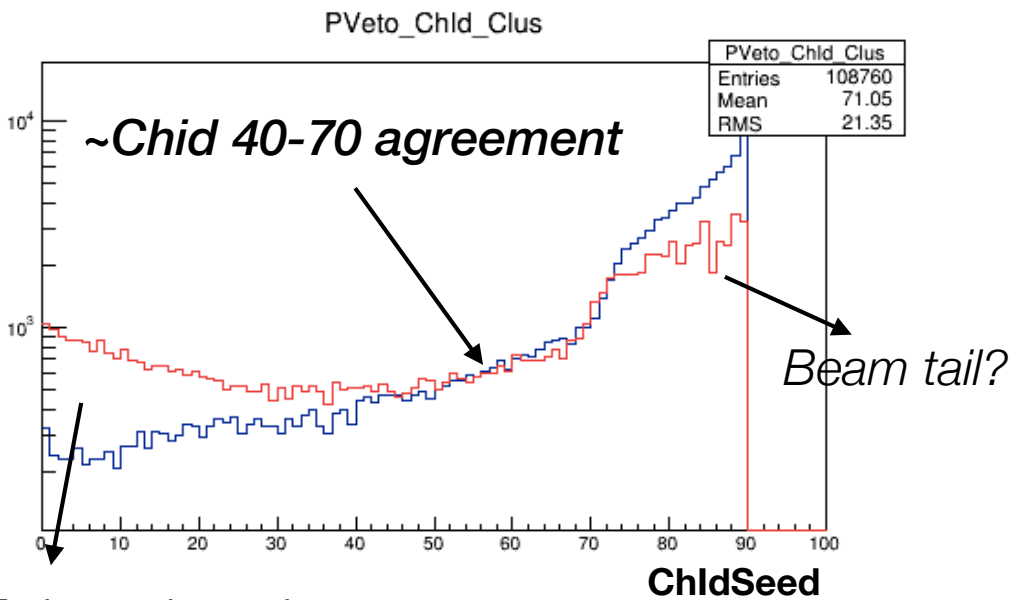

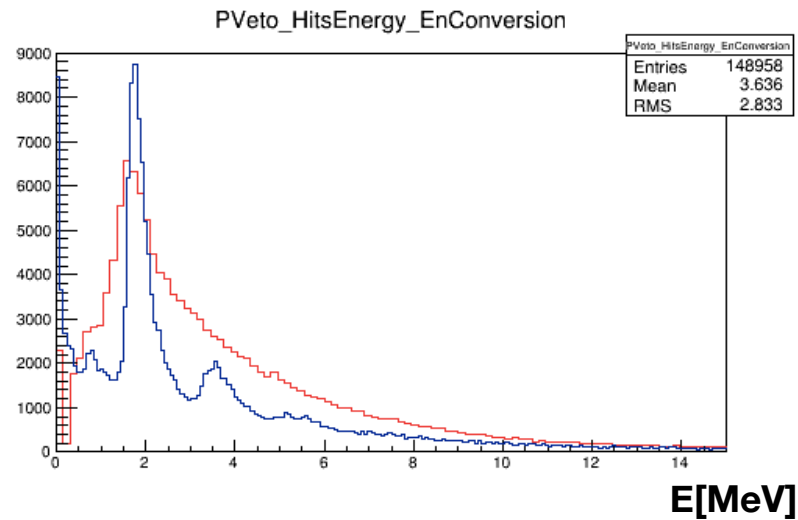

$$\text{CF} \sim 30.3 \text{ mV/MeV}$$

DATA, thr Hit/Seed 2.5 mV delta cluster time 2ns

MC digi 17 ns, thr Hit/Seed 0.1 MeV, delta cluster time 2ns

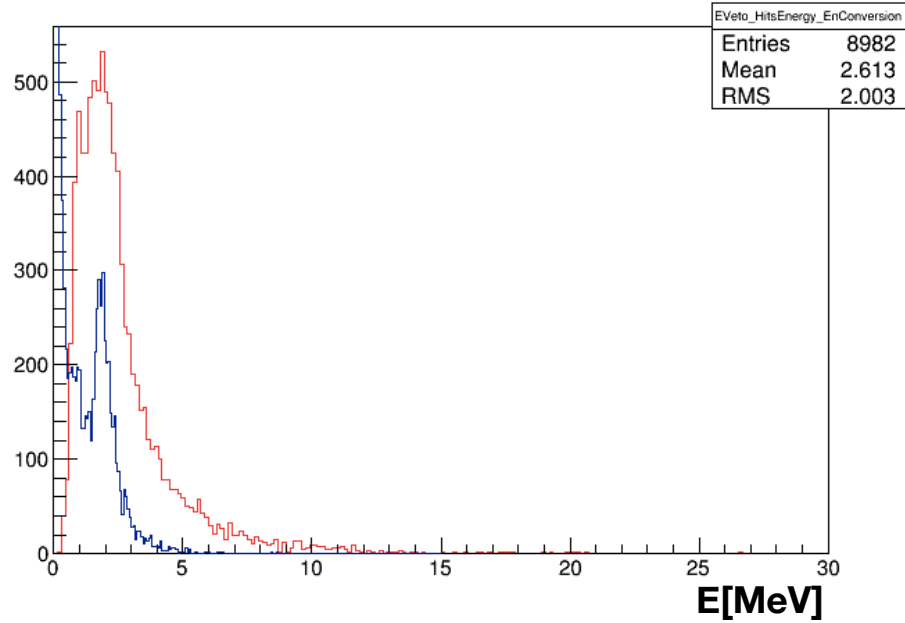

1000 events

Develop Thrs for Reco Peak Search

To investigate better

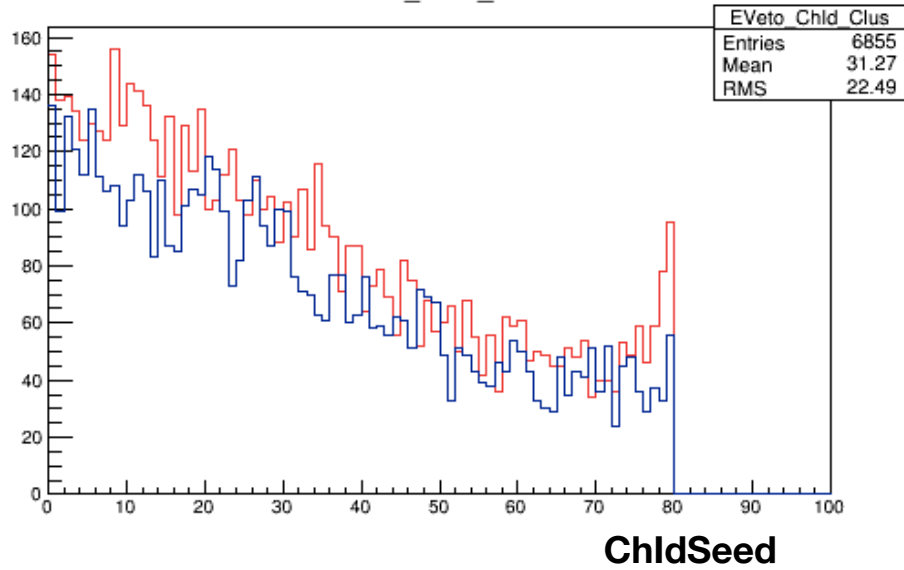

EVeto_HitsEnergy_EnConversion

EVeto_ClustersEnergy_EnConversion

EVeto_Chld_Clus

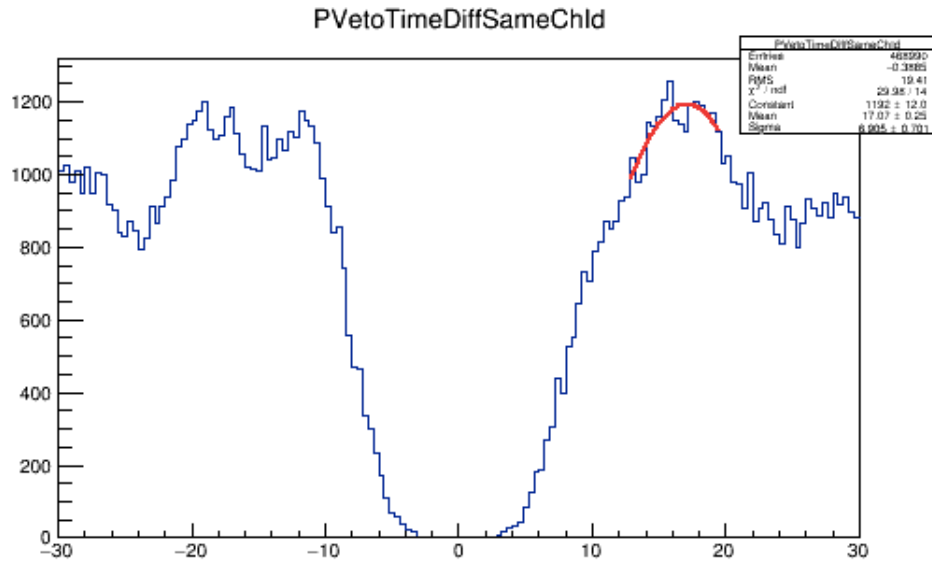

EVetoClusSize

Difference between two hits of the same Chld, DATA

Check for

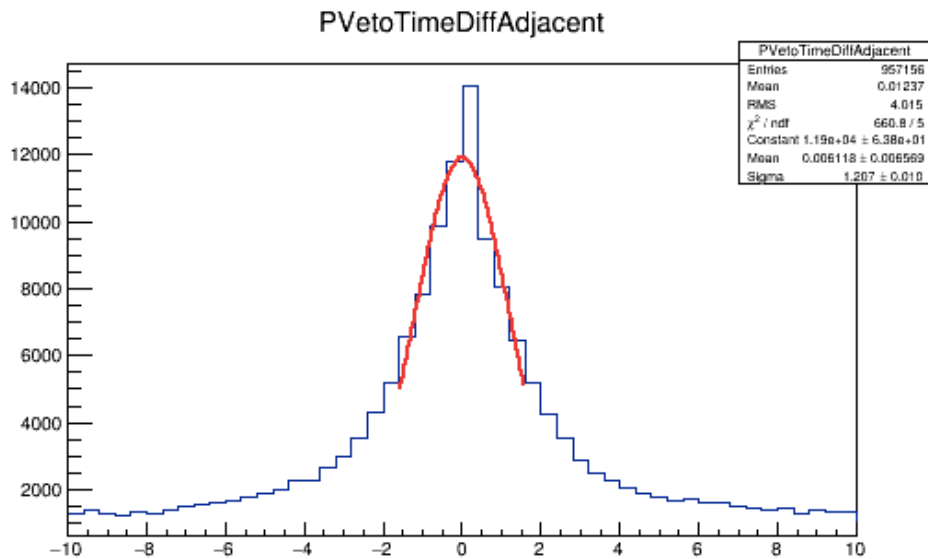

**DATA Amp Thr Low/High 2 mV
for Peak Search**

Mean~17.07 ns

Difference between two hits of two adjacent Chld, DATA

~Same as higher thresholds

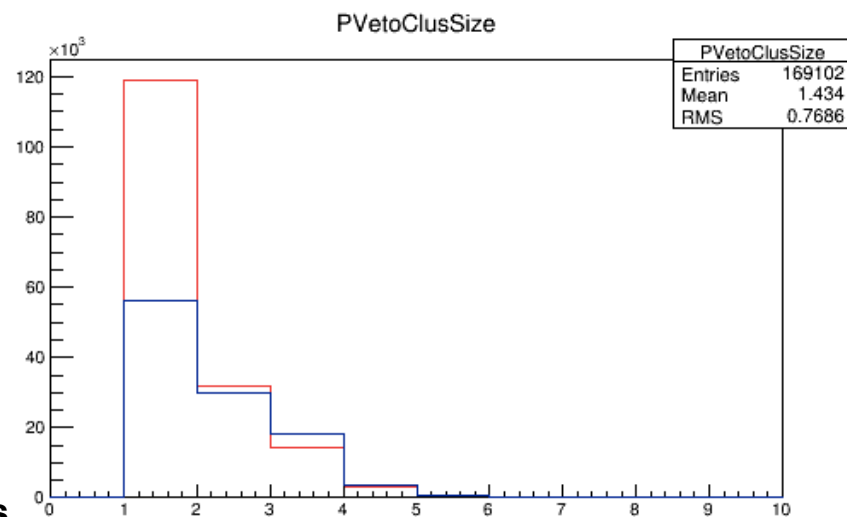

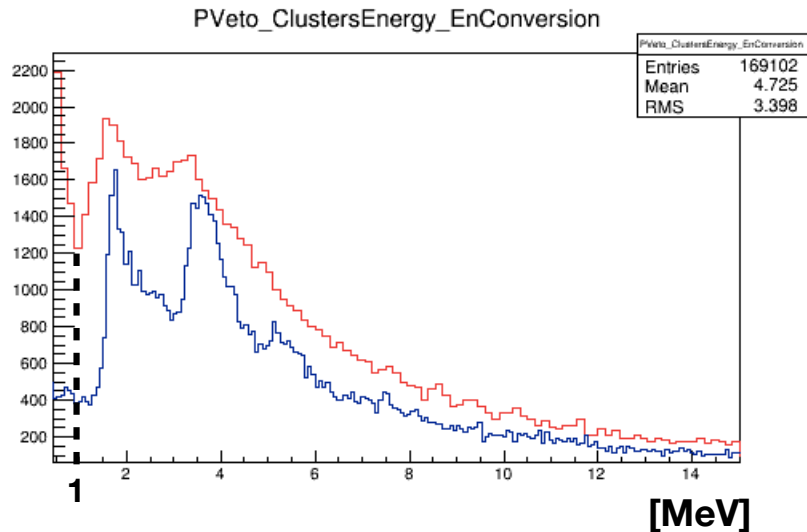

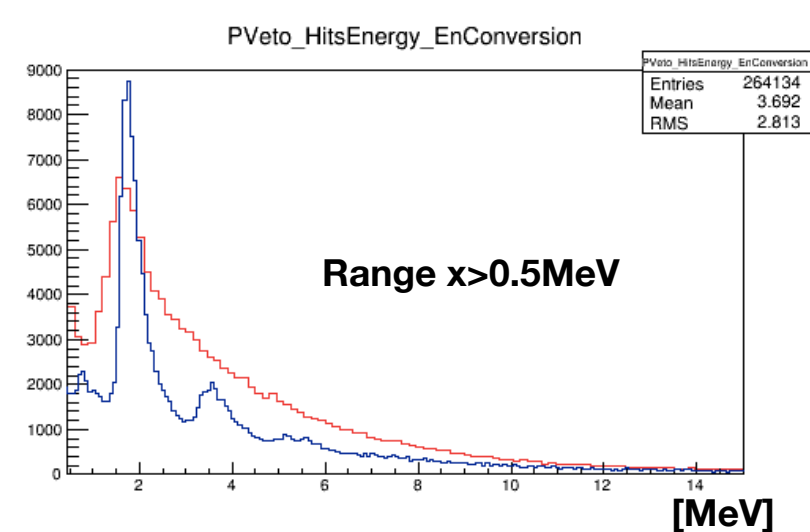

sigma~1.2ns

DATA, thr Hit/Seed 2.5 mV delta cluster time 2ns

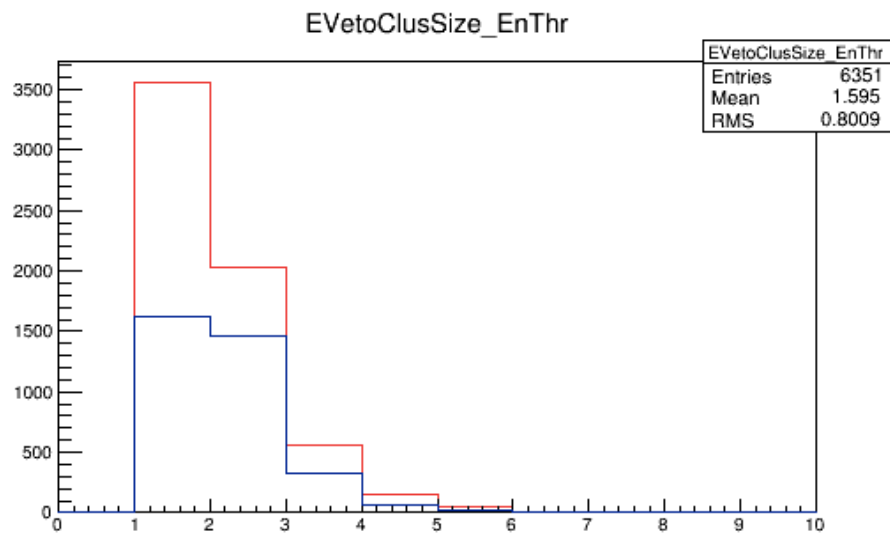

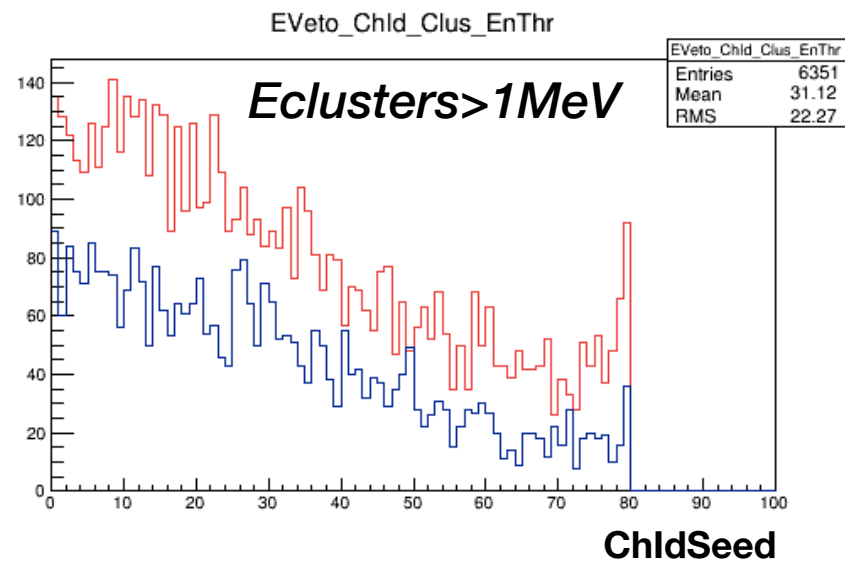

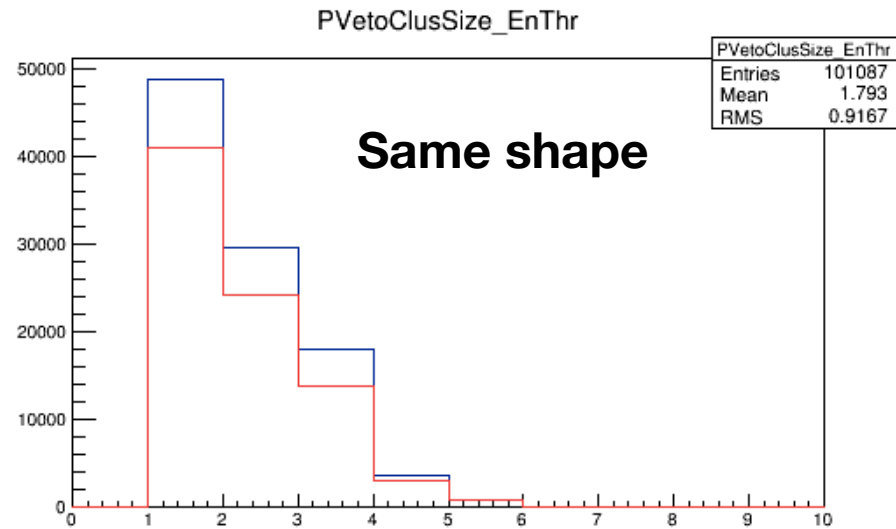

1000 events

MC digi 17 ns, thr Hit/Seed 0.1 MeV, delta cluster time 2ns

Amp Thr Low/High 2mV for Peak Search

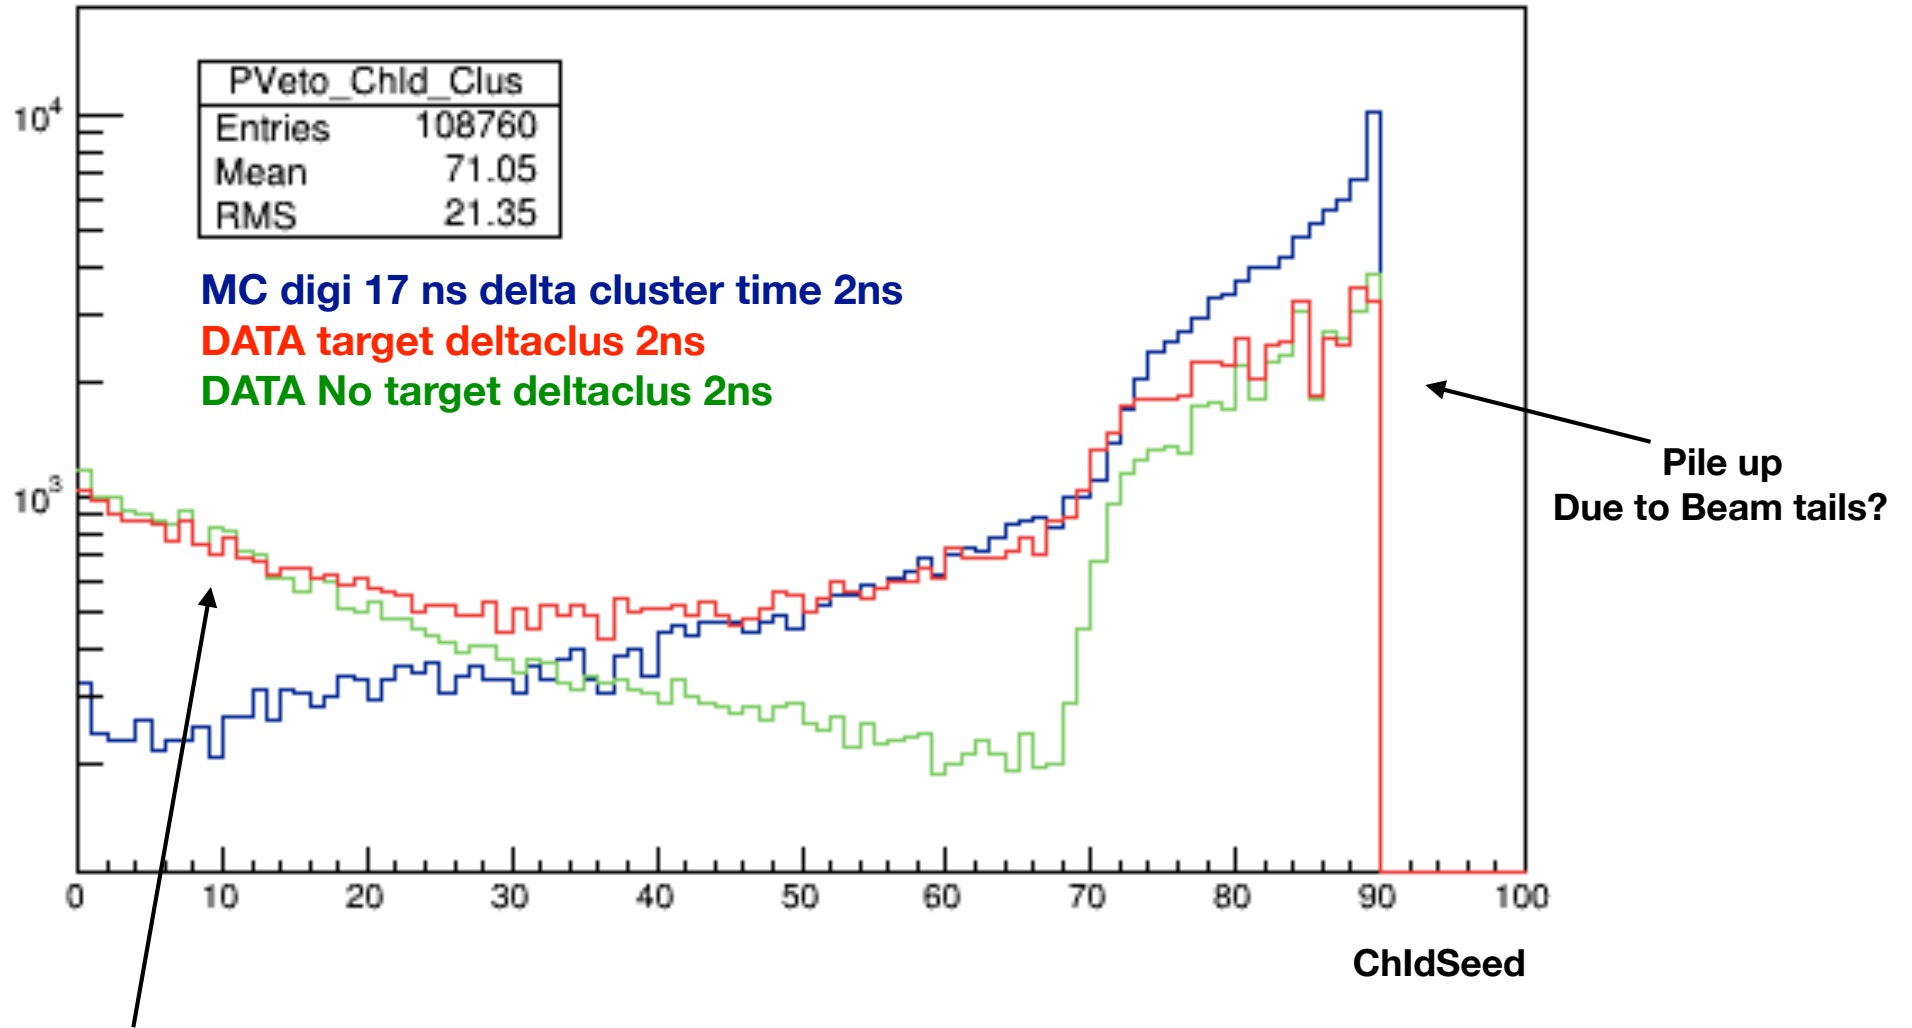

Energy Thr has to be set $E > 1 \text{ MeV}$

To understand better the mismatch

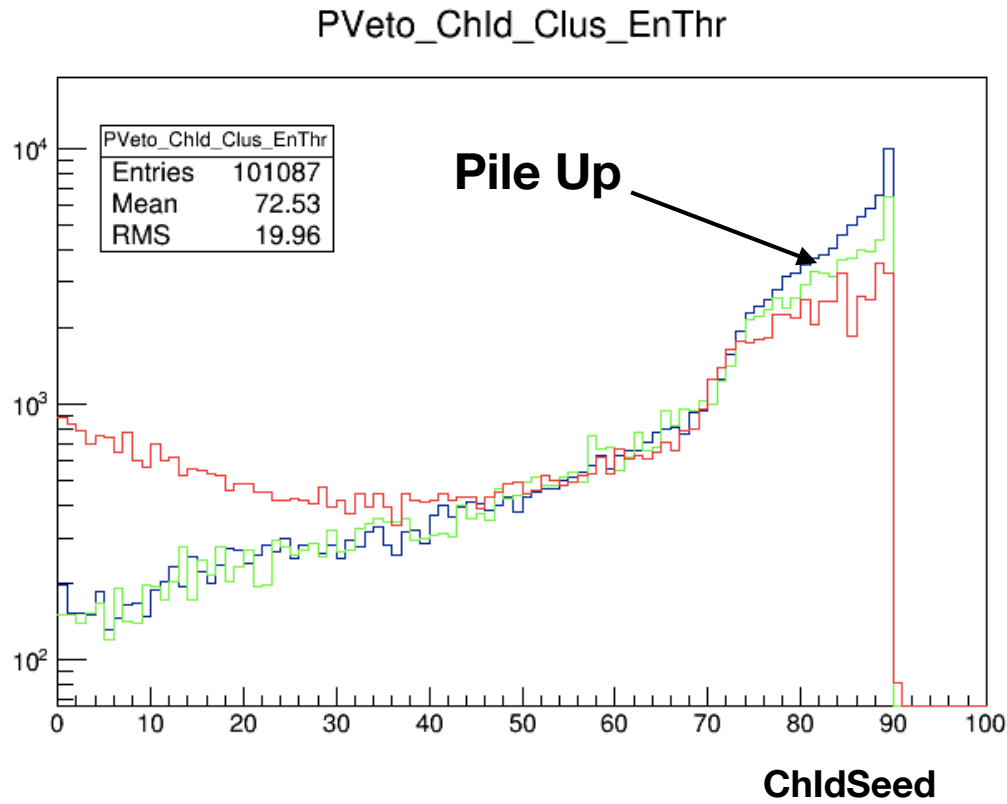

Develop Thrs for Reco Peak Search

PVeto_Chld_Clus

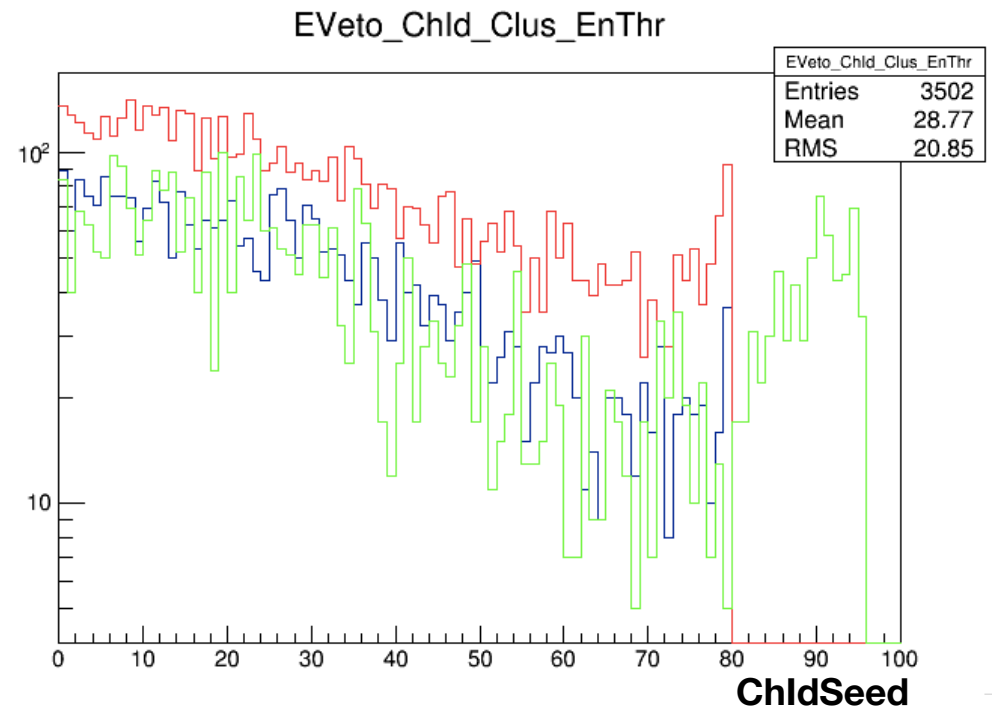

Chid<18 with target&without target are in agreement

Comparison MC with the DATA bunch length (150 ns)

DATA
MC def Bunch length 250ns
MC Bunch length 150ns

First Conclusions

The MC Digi Time Window is set at 17 ns, emulating the time integration of the Veto front-end response

After parameters tuning, July data showed an energy spectrum, a cluster size and an occupancy semi-qualitative similar to MC (in particular from ch 40 and 70)

Mismatch at low fingers (OccupancyDATA>OccupancyMC) *To investigate better*

and high fingers (OccupancyDATA<OccupancyMC) *Beam tails?*

To do:

study on thresholds for hit and seed

Tuning between MC and DATA is still underway.
