

# **CMS Muon preventivi 2021**

**sandro ventura**

# CMS Muon Organigram 2020

# CMS Muon Phase-2 Upgrade Master Schedule

3

## **Unusual Phase-2 Upgrade schedule:**

- Large part of upgrades (CSC, GE1/1, GE2/1, RE34/1) must be complete before LS3, in some case as early as during LS2
  - This is driven by the limited excess to the endcaps during LS3

All schedules are updated to be in sync with the new Nov 2019 LHC schedule

**GE2/1 and RE34/1 schedules are fully updated for the first time since TDR**

- They were not put up for re-baselining in May 2019 in anticipation of major Run 3 schedule changes, more specifically, **Run 3 YETSS**

# DT Phase 2 : TDR Path updated

## R&D steps:

- dimostrare il multichannel TDC su FPGA e la portabilità degli algoritmi di trigger in asincrono
- qualificare la nuova architettura su di una camera intera
- valutare il track finding strumentando un intero settore (4 camere)

2017

2018

2019/20

Nel 2021:

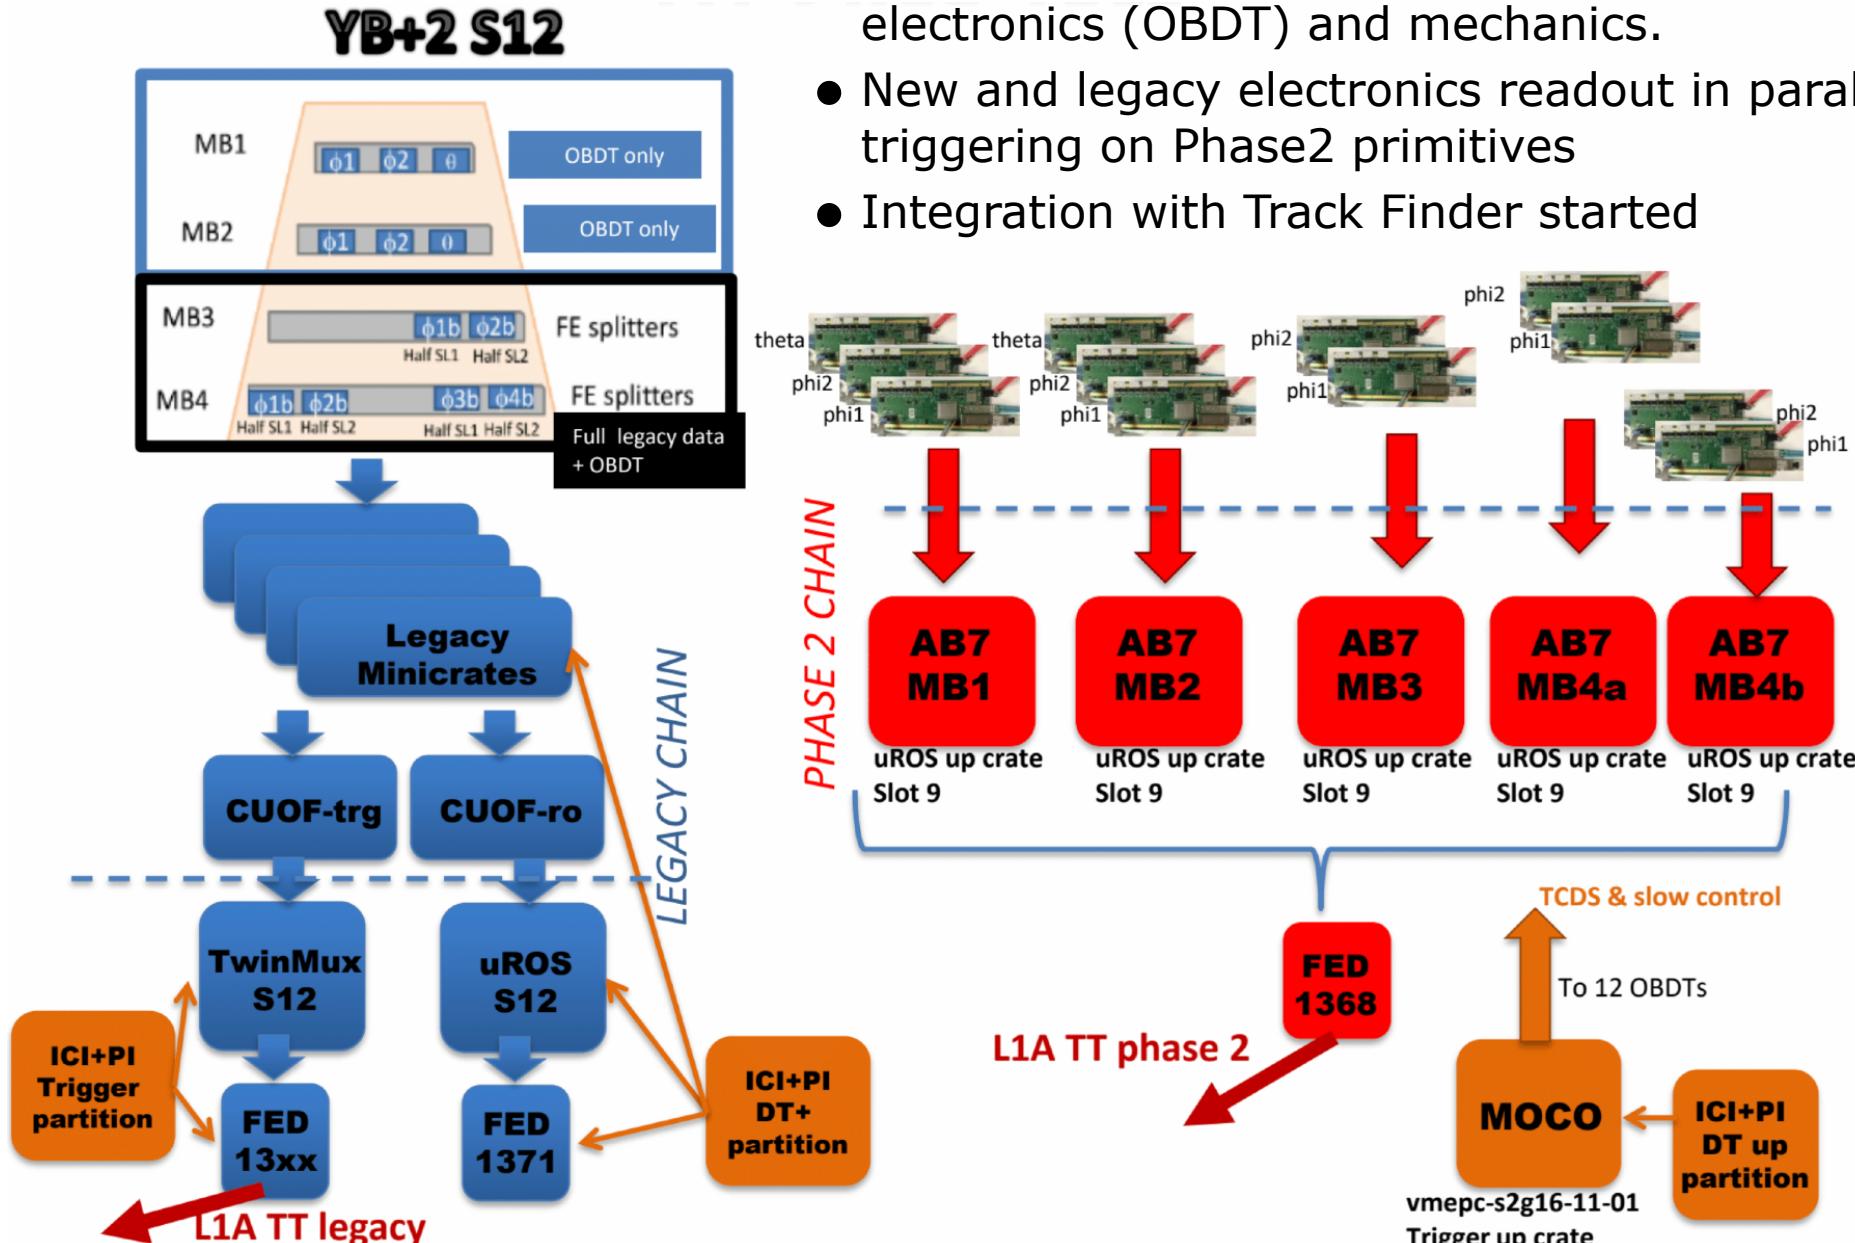

- OBDT Preprod validation

Table 3.6: High Level and External Milestones (HM and EM, respectively) for the DT upgrade.

	ID	Milestone title	Date
Design	DT.RD.FE.1	DT FPGA demonstrator: firmware implementation of multichannel TDC done (HM)	5.Dec.2016 ✓
	DT.RD.BE.1	DT simulation: demonstration of L1 trigger pattern-recognition performance from DT TDC output done (HM)	11.Jan.2017 ✓
	DT.RD.FE.2, DT.RD.BE.2	DT L1 and Readout System specification defined with demonstrator (HM)	7.Jun.2017 ✓
Prototyping	DT.RD.FE.3	OBDT demonstrator tested on DT chamber(s) (HM)	5.Mar.2018 ✓
	DT.RD.FE.4, DT.RD.BE.3	DT prototype ready for slice test validation at PT5 (HM)	14.Nov.2018 ✓
	DT.RD.FE.5, DT.RD.BE.4	DT prototype electronics (MiC2 and back-end) validated (HM)	4.Nov.2019 ✓
Production	DT EDR (EM)		Now → 1.Jun.2020 ✓
	DT.PP.FE.1	DT Final MiC2 pre-production validated (HM)	1.Jun.2020 ✓
	DT ESR apr '21		Apr '21
	DT.PR.FE.1	OBDT PCB start of assembly phase (HM)	14.Jul.2021 ✓
	DT.PP.BE.1	DT Back-end pre-production system validated (HM)	6.Jul.2022 ✓
	DT.PR.FE.2	DT: MiC2 production ready (HM)	22.May.2023 ✓
Nel 2021:	DT.PR.BE.1	DT Back-end production completed (HM)	17.Apr.2024 ✓
	DT.PR.FE.3, DT.PR.BE.2	DT ready for installation (HM)	17.Apr.2024 ✓

# DT: the Phase2 Slice Test

- One full sector (YB+2/S12) with prototypes of new electronics (OBDT) and mechanics.
- New and legacy electronics readout in parallel, also triggering on Phase2 primitives
- Integration with Track Finder started

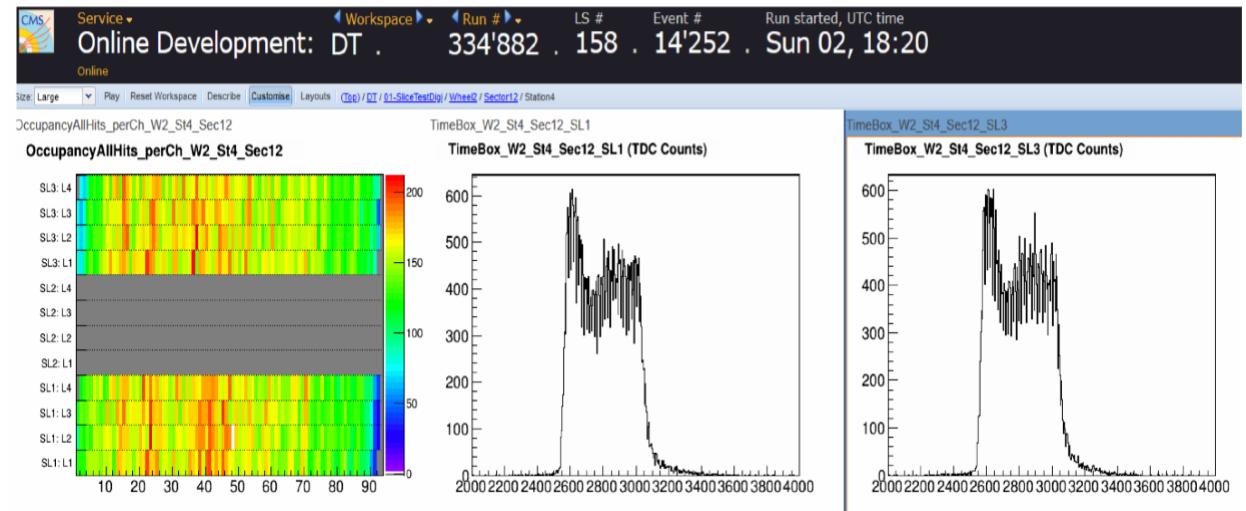

# DT: the Phase2 Slice Test

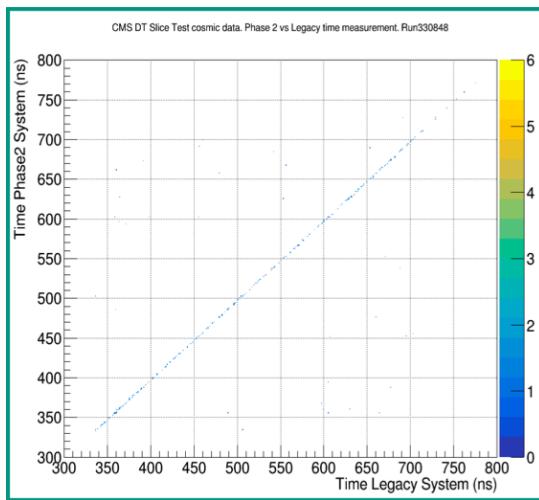

Event by event comparison shows full consistency

OBDT architecture and firmware validated

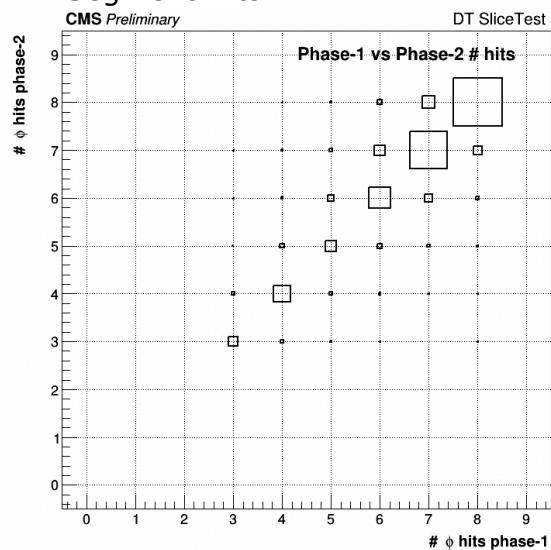

DQM metrics

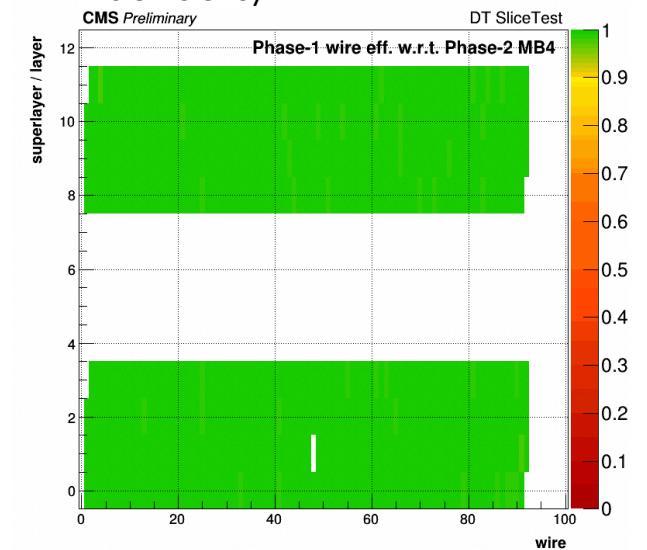

TDC measurements

Segment Hits

Hit efficiency

Parallel readout remains for the four YB+2/S12 stations in Run3: validation with beam conditions

# DT LS2 restart at the pit

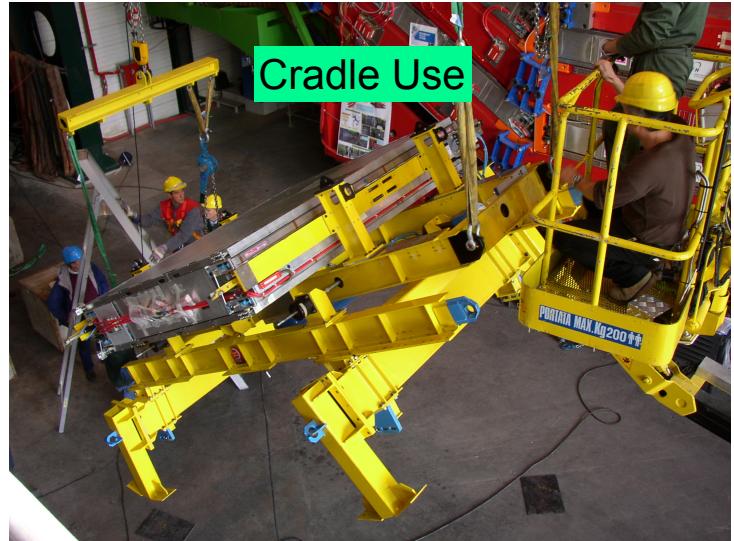

**Back in September?**

1. Alberto's MB4 shielding: **95 % done**; only YB+1 vertical sectors remains
  - Material is ready
2. Phase 2 Slice Test : **prepare for Run 3**
  - Reinstall minicrates in MB1/MB2
3. Minicrate repairs: **90 % done**
  - 7 interventions in YB+1
  - 3 in YB+2,1 in YB-2
4. DT chamber extraction ( YB+2 S7 MB2)
  - Lost full theta view in Run2
  - **Largest DT maintenance operation** in term of recoverable channels
  - Would allow to inspect a wire (again)

Can start

October?

1st week of  
September

	Jun 2020	Jul 2020	Aug 2020	Sep 2020	Oct 2020
Non Critical Path 2	DT Mini Crate Phase-II Upgrade		<b>DT MiC2 Slice Test</b>		
Non Critical Path 3	Endcap&Barrel RPC repairs MB4 Shielding	RE+3/1 cabling	GE+2/1 cabling	DT	DT MC YB+ Commissioning RPC gas/LV/HV

**"Prudent" strategy wrt uncertainty in travel restart**

# DT Upgrade EDR Scope & Panel

25 June 2020

The Committee is asked to review:

- The readiness of the design of the Muon Drift Tubes electronics for HL-LHC.
- The feasibility of the installation plan in LS3, its impact and implications for CMS or other subdetectors.

## Goal of the review

Endorse the design of the Muon Drift Tubes electronics for HL-LHC and thus authorize spending of CORE resources to start procurement of system components, subject to remarks and recommendations which the Committee may see fit to make.

### Review Committee:

#### Link Person:

- Ignacio Redondo, *DT Project Manager*

#### Technical Coordination:

- A.Ball, *Technical Coordinator*
- M.Capeans, *Upgrade Technical Coordinator*
- M.Hansen, *Electronics Coordinator*
- A.Gaddi (CERN) *Integration Office Lead*
- N.Dupont/R.Perruzza, *LEXGLIMOS*

#### Experts:

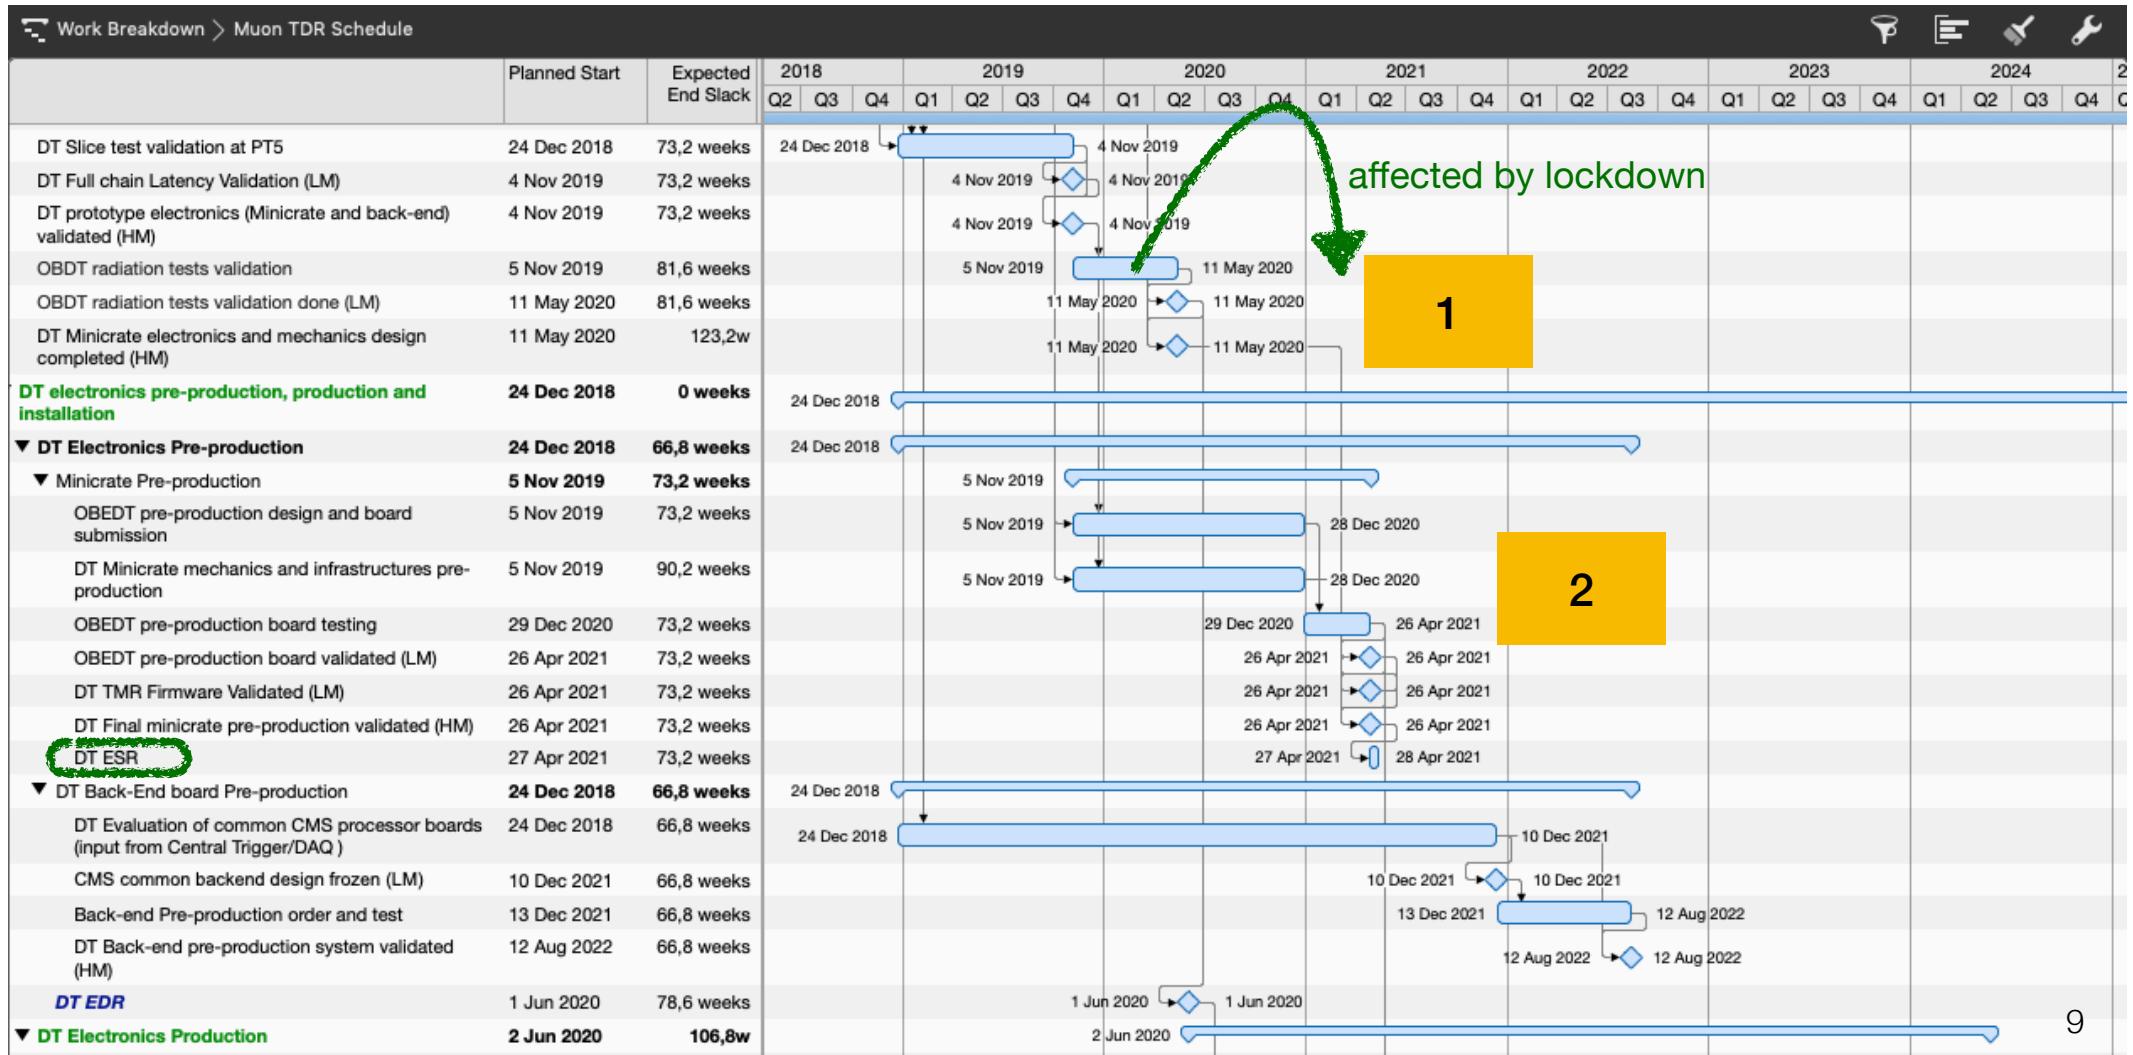

- A.Colaleo (Universita e INFN, Bari)
- T.Grassi (University of Maryland)
- G.Iles (Imperial College)

#### Ex-officio:

- F.Hartmann, *Upgrade Coordinator*
- A.Cardini, *P2UG member*
- M.Martinez, *P2UG member*

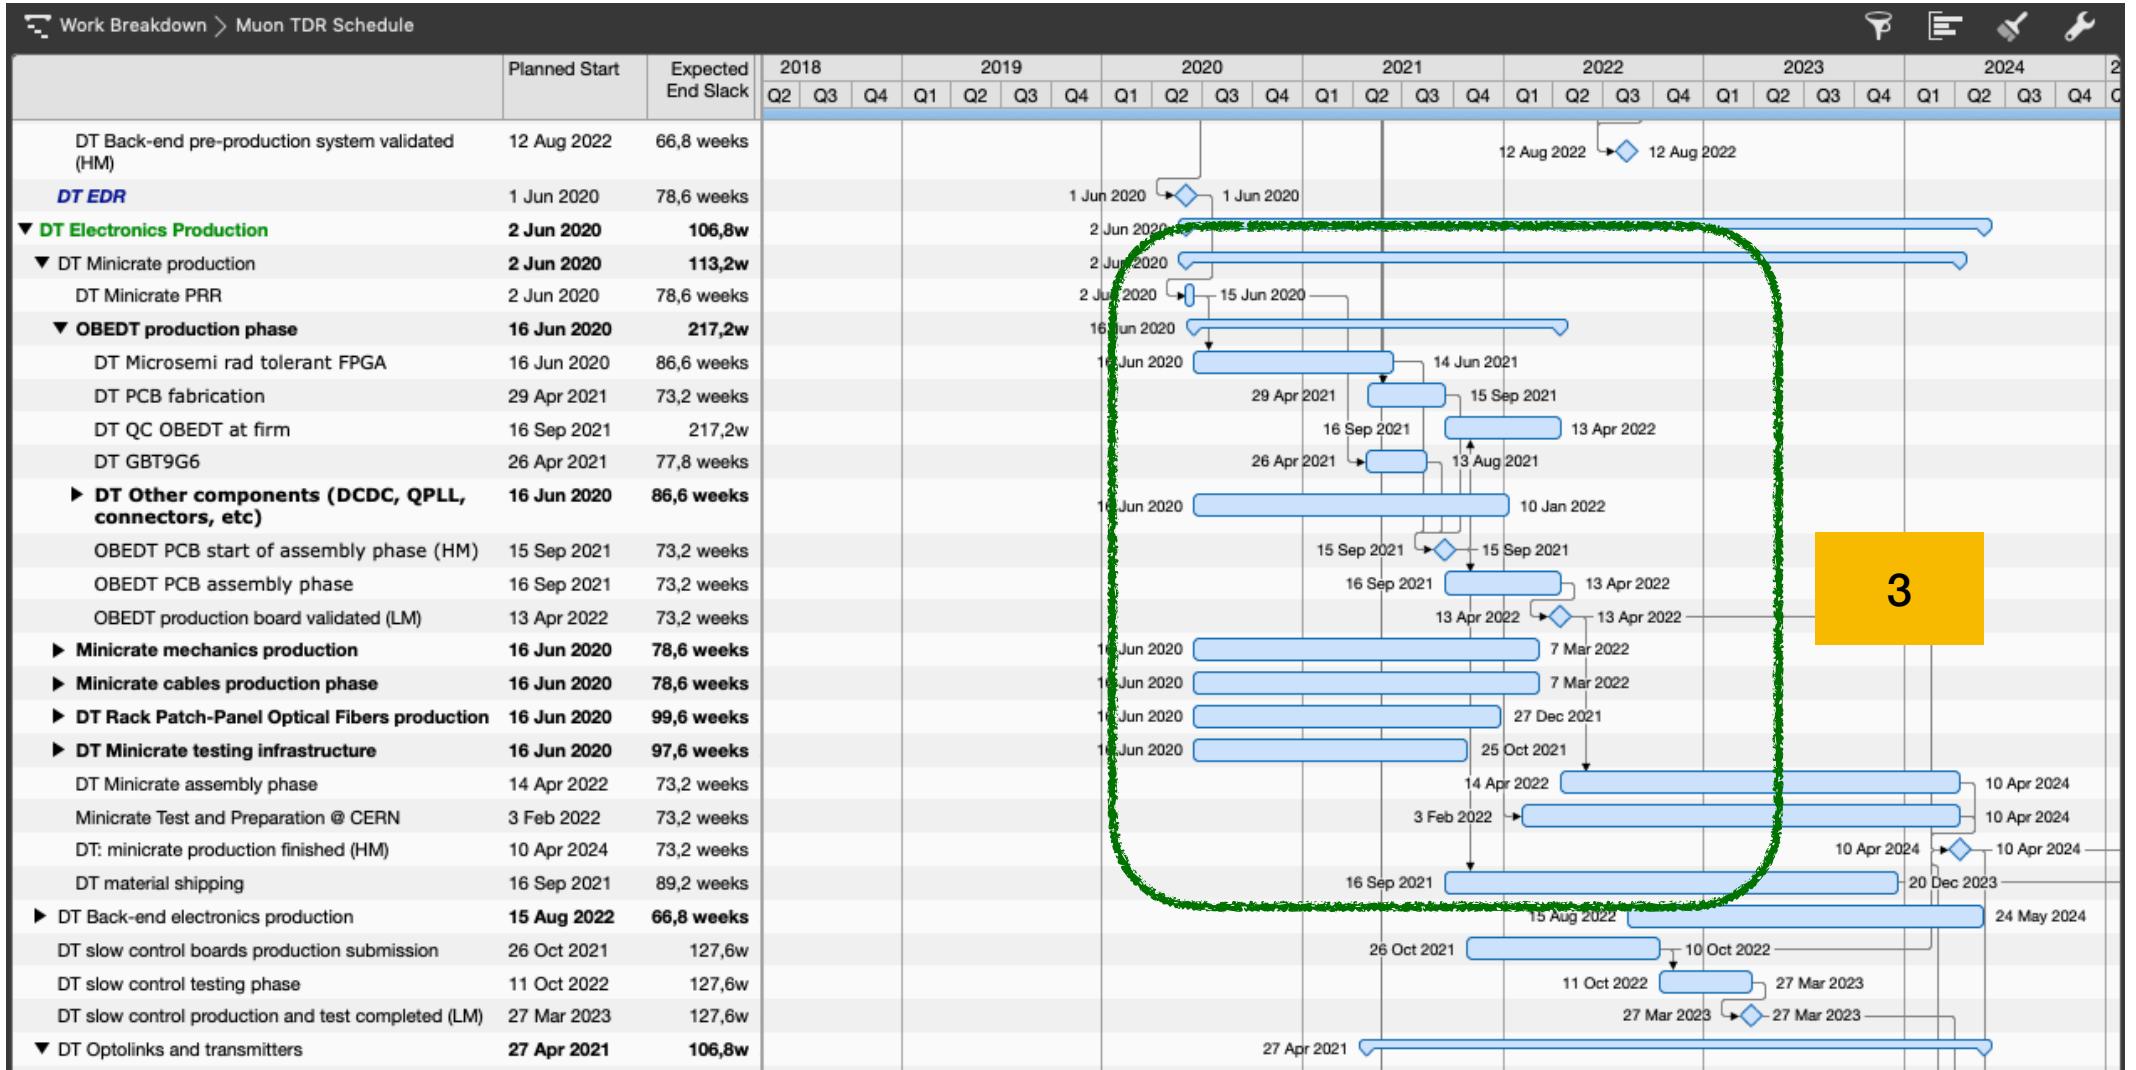

# Through DT Merlin to LS3

- 1 Reschedule Irradiation tests, after agreement with EC to fulfil ESR requirements
- 2 Stretched Pre-production design and testing to include improved solutions  
(e.g. coax cabling, larger FPGA, DC-DC vs LDO)

# Through DT Merlin to LS3

## 3 Adjusted PCB production, assembly and testing tasks

3

# Richieste DT 2021

# Short overview Activities RPC

Context: 2nd year of LS-2: HW activities going towards end; Commissioning will start  
Covid-19 has introduced 3 months delay on schedule, CERN has restarted  
Preparing for Phase-2 construction to start in 2021

1

## RPC Leak Repair

- GWP CERN Priority
- Normally finished by Dec 2020, but remain ready to exploit further opportunities in 2021

# Phase-1 RPC Activities: P5

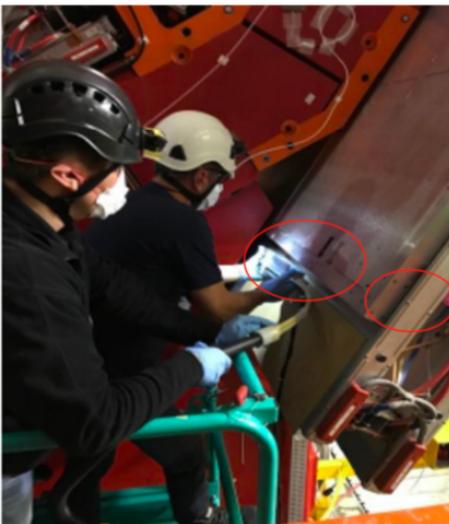

## RPC Leak repair campaign

Extensive RPC leak repair campaign has been carried out during LS2

### Barrel chambers:

REPAIRED	INSPECTED AND potentially REPAIRABLE	Leak not identified	NO reparation possible with partially extraction
53%	3.5%	23.5%	20%

### Example of repair procedure

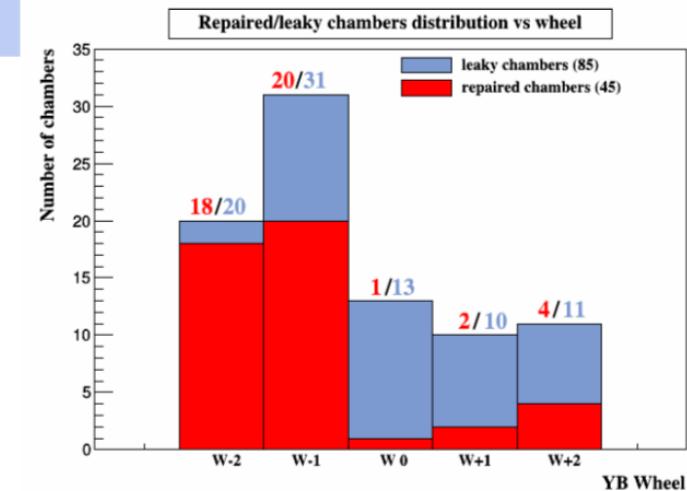

- Two new leaks developed since beginning of March located in W-1.

### To be done:

- Repair of 2 more chambers is foreseen in September (+barrel wheels) in W+1/S04/RB4 where a modification of the extractor was required.
- Standard gas maintenance: perform leak inspection and connect the leaking (working) chambers to gas channels shared with another leaking (working) chamber to allow disconnection from the rack also when there is no access to the wheel. **Done in the negative barrel wheels.**
- Endoscope inspection of the positive and external barrel wheels.

### Endcap chambers:

- Replaced 9 leaky chambers with spare chambers in RE-3, RE-2 and RE+3.
- One more leaking chamber to be replaced in RE-3.

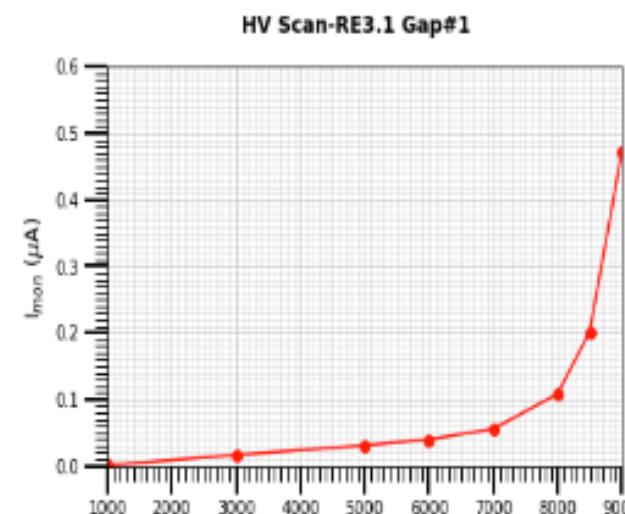

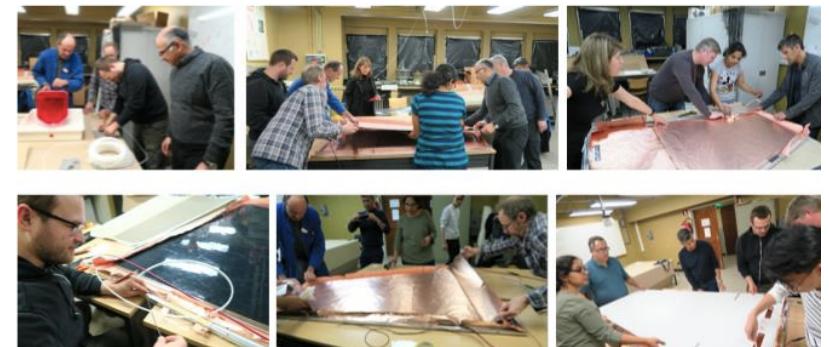

# iRPC: first RE3/1 VO

In January 2020, the first two prototypes of the 3.1 station were assembled in UGent RPC Lab by a team of technicians and physicists from Gent Univ., all 3 Mexican Universities and Lyon group.

- All gaps received and QC tested (spacer, leak and darks currents tests)
- Assembly chamber procedure revised and manual prepared.
- One 3.1 prototype transported to Lyon for electronics integration

Plan to test the 3.1 prototypes at CERN in 904lab first and then in GIF++

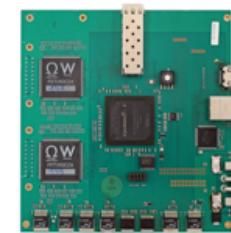

# iRPC: FE electronics validation

**FEBv0:** A board that contains:

- **1 PETIROC2A ASIC + FPGA (Cyclone 2)**
- Ethernet-based communication was conceived to read out the strips PCBV0 (44 strips)

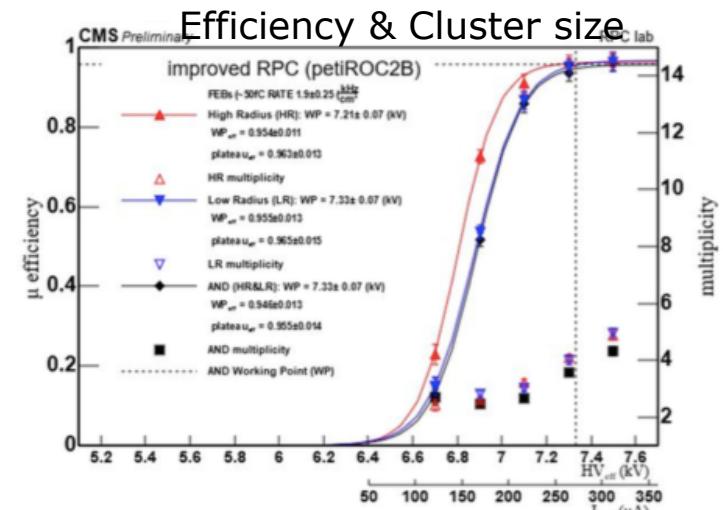

**FEBv1:** This was intended to come closer to the final board to be compatible with CMS DAQ:

- **2 petiroc2A(B) + FPGA Cyclone V**
- Ethernet-based communication is used to read out the strips PCBV1 (48 strips)

## Validation of FEB\_V1

- An iRPC with **FEBv1** was tested using a cosmic trigger made with shielded scintillators
- Efficiency plateau is  $\approx 95\%$  with  $\approx 2\text{kHz}/\text{cm}^2$  of background and a threshold of 50fC
- Upgraded teststand to work inside GIF++
- irradiation tests are planned for Sep 2020 and then again in 2021 with the final rad-hard version

## FebV2 :

- All procurements shall arrive by July 2020 : ASICS, FPGA's, GBTx etc..
- September 2020 : production and cabling of 2 prototypes  
(if cabling company available in August)
- December 2020: 3 month of electronic tests + finalization of the test system. Work on chamber would start after.
- January 2021 : order for 20 FEB V2 if tests successful

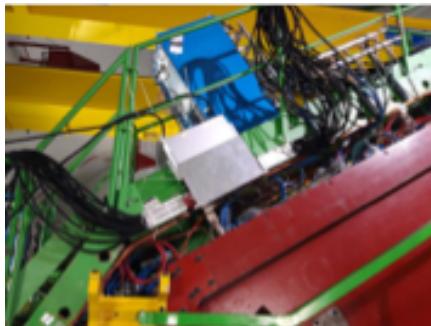

# iRPC: RE3/1-4/1 services

Installation of RE-3/1 and RE+4/1 services: completed (in 2019)

Installation of RE+3/1 services started in Feb 2020

- Gas pipes and impedance boxes installed
- HV and LV cable installation planned for early summer 2020

Remaining 40% to be installed (HV/LV of RE+3/1 and RE-4/1) rescheduled awaiting confirmation of updated LS2 plans (summer/autumn 2020)

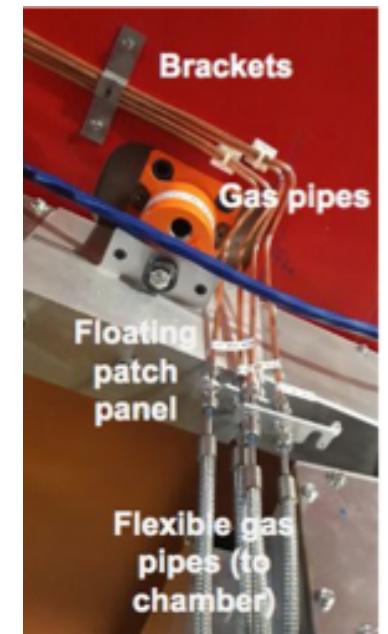

Fiber optics box installed  
back of YE-3 and Y+3

Gas impedance boxes

RE4.1 cooling

# RPC: attivita' INFN in LS2

## Completamento attività di manutenzione straordinaria

La previsione è di terminarle entro la prima parte del 2021, tenendo conto del rallentamento dovuto al covid-stop (RE-4 re-installation e re-commissioning, completamento manutenzione HV sull endcap, completamento riparazione perdite di gas ecc. ..)

## Completamento manutenzione straordinaria del gas system

riparazione o sostituzione delle flow cells malfunzionanti

Completamento installazione del sistema per la riduzione dei gradienti pressorii all'interno delle camere (valvole automatiche e camera dummy)

## Re-commissioning RPC system (local & global)

## Completamento installazione cavi & fibre ottiche su endcap negativo

causa covid-stop saranno terminate nella prima parte del 2021

## Equipaggiamento del prototipo real-size con FEB\_V2 e sua validazione alla GIF++

## Costruzione del dimostratore (6 camere iRPCs ) e test @ 904

installazione prevista durante EYETS 2021/2022 (\* dipende da TC)

## Test camere del dimostratore alla GIF++

## Test con eco gas (sia per RPC che iRPC)

# Phase-2 RPC Activities @ GIF++

- **RPC & iRPC Longevity studies @ GIF++**
  - Ageing tests:  $1\text{C}/\text{cm}^2 + \text{iRPC rate capability}$  ( $2\text{-}3\text{kHz}/\text{cm}^2$ )
    - 78% Complete for RE2; 44% Complete for RE4
    - Efficiency curves overlap after correction for bkg
  - Study use of more ecofriendly gas (HFO1234ze)
  - Production of HF in EcoGas & StandardGas
- **iRPC tests (Phase-2)**
  - Readout iRPC decision towards Petiroc (March 2020) however not yet demonstrated full performance (only  $2\text{kHz}/\text{cm}^2$ )
  - Therefore maintain Alternative option (Cardarelli – Tor Vergata) Prototype iRPCs tested in GIF++.

## ECOGAS STUDIES @ GIF++

R&D on a new ecological RPC gas mixture started in GIF++ in April 2019:

- Five RPCs (2 CMS, ATLAS, ALICE, EP-DT) under test. One RPC equipped with CMS electronics.
- Two eco-gas mixture based on HFO 1234ze ( $\text{C}_3\text{H}_2\text{F}_4$ ) tested so far:

  - HFO - CO<sub>2</sub> - iC4H10 - SF<sub>6</sub> (45 - 50 - 4 - 1%)
  - HFO - CO<sub>2</sub> - iC4H10 - SF<sub>6</sub> (35 - 60 - 4 - 1%)

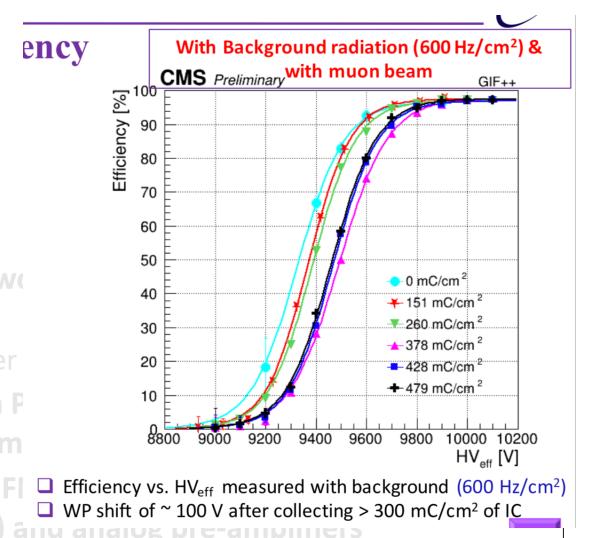

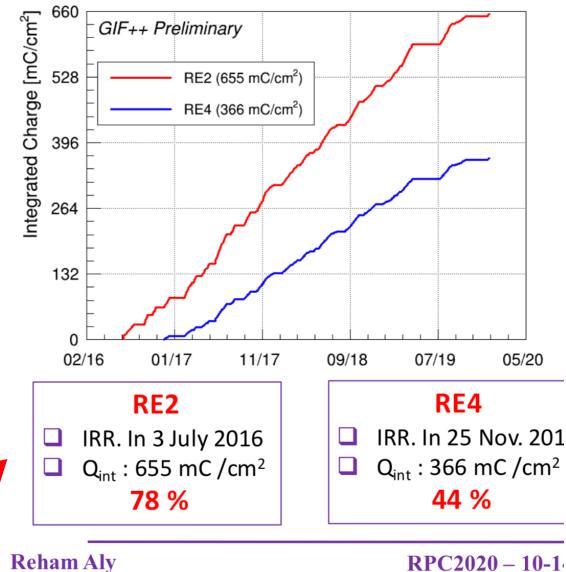

Preliminary considerations: an increase of current after some time observed with both gas mixture. Not clear results.

Plan is to take data at reduced humidity in order to understand if the current increase is related more to the HFO or to the humidity.

All results are here:  
<https://twiki.cern.ch/twiki/bin/view/CMS/ECOGASRESULTS>

- 1.4 mm chamber with two 50 kΩ (\*)
- → Study effect on cluster
- Chamber equipped with P resistivity regions (5 mm)
- Tests performed with INFI (TDC) and analog preamplifiers

# Richieste RPC 2021

# Short overview Activities GEM

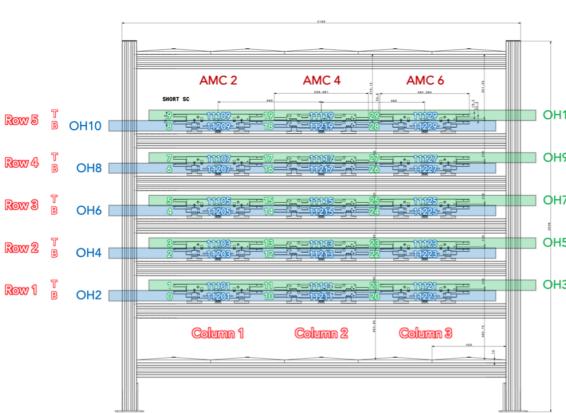

Context: 2nd year of LS-2: HW activities going towards end; Commissioning will start  
Covid-19 has introduced 3 months delay on schedule, CERN has restarted  
Preparing for Phase-2 construction to start in 2021

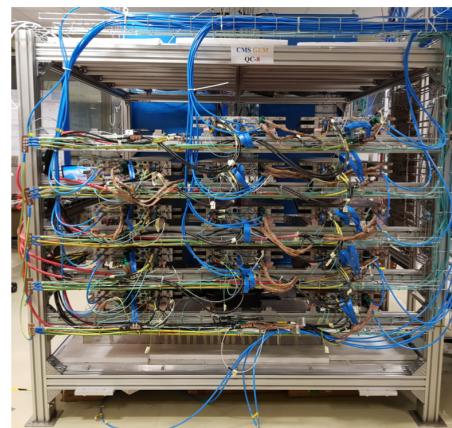

# Phase-1 GEM Activities: GE11

- Summer – Fall Activities GE11(2020):
  - Refit spare chambers with electronics + valid QC6-7-8
  - Validation final positive endcap in cosmic stand
  - Installation positive endcap in p5
  - Installation services (LV, HV, cooling) in p5
  - Commissioning of pos & neg endcap in p5
- GE11 Activities in 2021:
  - Commissioning GE11 in MWGR and CRuZeT & CRAFT
  - Refurbishment ME11 Cooling Negative Endcap requires cabling & uncabling GE11

Ideal stand

Real stand

## Cosmic Stand is Large Experiment:

- **92k readout channels!**
- CMS-like DAQ based on uTCA be
- Frontend calibration procedures
- DCS (HV, LV, Gas, P,T) control & monitoring (data stored in DB)
- Offline DQM

# Phase-2 GEM Activities: GE21

- Lessons learnt from GE1/1 implemented for Phase 2

- (1) Packaged VFAT3 chip to avoid bounding problems on small pads
- (2) Double Segmented foils reducing the discharge damage to FE

- GE21 Double-Segmented foils reduce detector capacitance

- But parasitic signal is picked up
- Careful balance between discharge protection & cross talk required
- Production of GE2/1 foils halted
- Investigations in Lab ongoing, solution identified but verification interrupted due to shutdown CERN

- **Summer – Fall Activities GE21(2020):**

- Verification identified solution GE21 for discharge & cross-talk
  - → will allow to (re-)launch GE21 Foil Production
- Testing of Packaged VFAT3 hybrid & GE21 Plugin Card
- Design & Prototype test of GE21 Construction Tools
- Preparation of Bari Construction Site

- **GE21 Activities in 2021:**

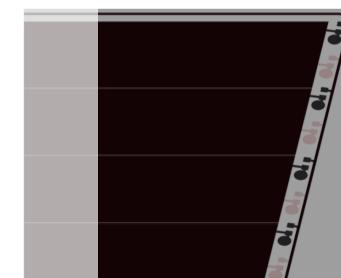

- Construction of 38 Modules GE21 M4 (Bari) + eventually also 10 M1
- Contribution to the QC/QA of Assembly components & preparation of various GE21 Assembly Kits to be sent to various construction labs (904)
- Refurbishment of Cosmic stand to host GE21 Chambers (904)
- Production of «Rolling Tables» to handle large GE21 Chambers (904)
- Installation of GE21 Demonstrator
  - Final QC/QA by Bari Physicists QC6-7-8 (904)
  - Installation & Cabling / Services (p5)

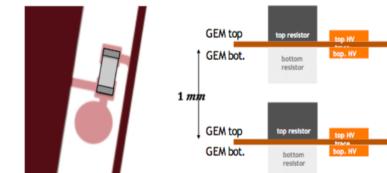

## Double segmented foils for GE2/1

- GEM double segmentation would:

- Reduce the propagation probability and the damage probability
- Improve the high voltage stability of the GEM-foil in case of discharges
- Allow efficient de-coupling of the bottom foil through protection resistor

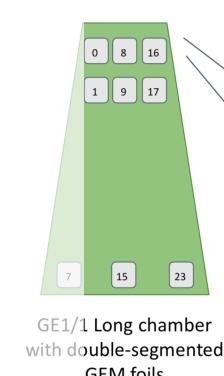

TOP side (in BLACK)  
BOTTOM side (in RED)

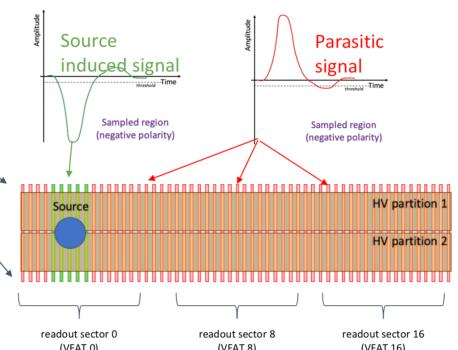

Bottom pad placed near the lower side of the same HV sector.

HV traces were moved away from the active area.

GMM CMS-Week GE2/1-MEO Status Report CERN, Feb. 4, 2020 p. 1

GE1/1 Long chamber with double-segmented GEM foils

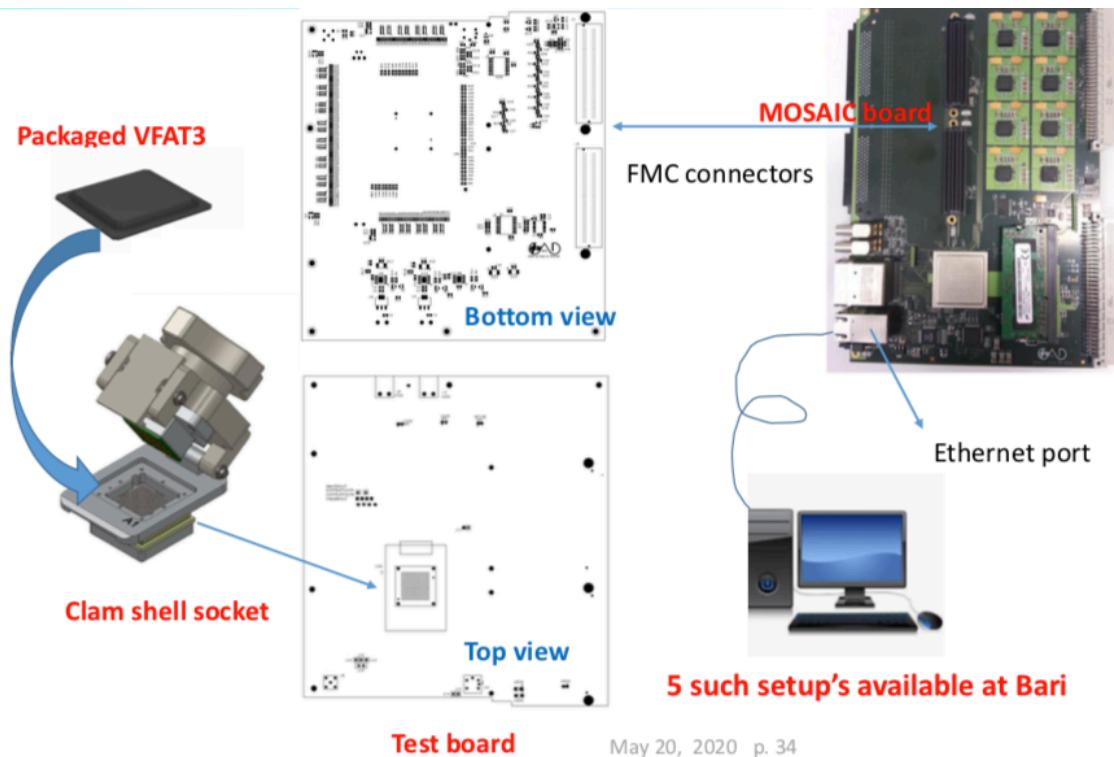

# GEM VFAT3 packaging status

Deliverable/milestone	Relative timescale	Estimated/actual date
Placement of the order by CERN	$T_0$	Half July 2019
Design files and associated reports	$T_1$	October 2019
Approval by CERN of the substrate design	$T_2$	October 2019
Delivery of the prototypes	$T_2 + 8$ weeks	December 2019
Approval by CERN of the prototypes	$T_3$	June 2020
Approval by CERN to start work on the series production	$T_4$	June 2020
Delivery of the series production (first batch)	$T_4 + 4$ weeks	July 2020

- ❑ It took some time for ASE got the remain component (high precision resistor for current monitoring).
- ❑ The substrate mounting(just passive components). Some scratches on wafer, should be OK
- ❑ VFAT3 placement, bonding and encapsulation.
- ❑ VFAT3 should arrive at CERN around 26th May.
- ❑ **Latest update: the 200 packaged VFAT3 prototypes have been shipped out to IMEC. they will be shipped to CERN soon**
- ❑ the packaging test hardware ready, FPGA firmware OK, sw in development

# VFAT3 packaged testing setups

5 such setup's available in Bari

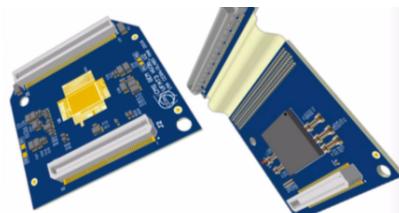

5 such setup's available at Bari

May 20, 2020 p. 34

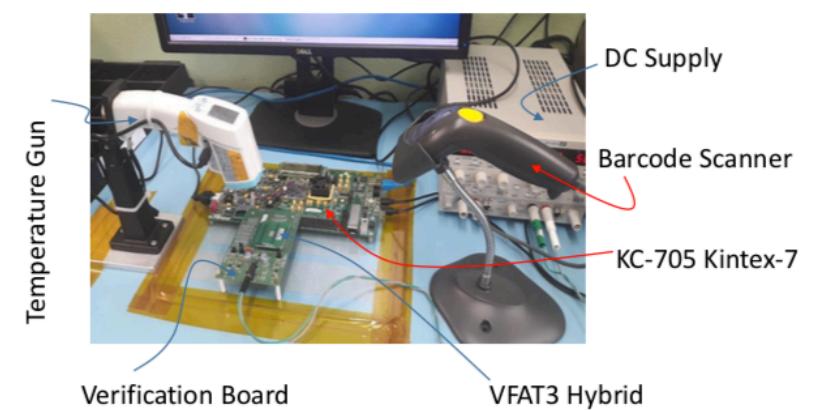

## Plugin card testing

GE1/1 VFAT3 hybrid and GE2/1 Plug-In card are very similar. Actually the digital connection to the GEB is the same:

- same panasonic connector
- same pin-out
- > can re-use the GE1/1 VFAT3 hybrid test bench

## Hybrid test station

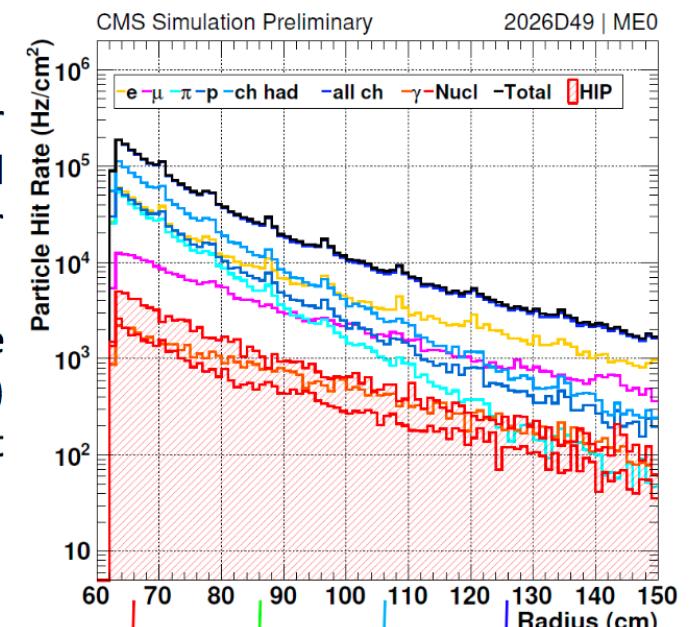

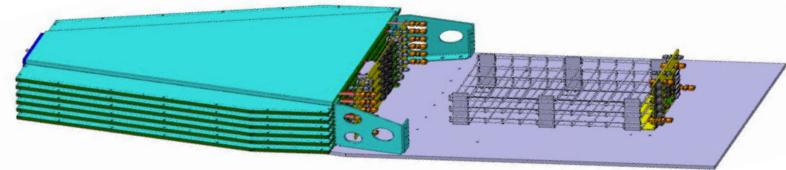

- ~2 minutes Test Time per hybrid
- Online database storage
- 2 set-up's available at CERN

# Phase-2 GEM Activities: ME0

- Design ME0 Readout Board & ME0 GEM Electronics Board (GEB) Inside GEM Electronics "Triad" group. Complex interplay between electronics & mechanical design
- Re-evaluation of ME0 background after HGCAL Design improvements point towards much higher rates that ME0 need to maintain. Design of new ME0 Shielding using Fluka simulations.

*Validation of Simulation results by performing Run-2 Data-MC comparisons for Fluka & GEANT for GE11 (Slice Test) and ME1/1*

- Redesign ME0 GEM Foils & ME0 powering to deal with Rate-cap Simulation studies to design size of HV segments

## MEO GEB design

ME0 OH will be based on LpGBT allowing for power consumption reduction  
ME0 GEB will be split in two separate domains powered by the same LV channel but now electronic components of mechanical parts will be shared between the two GEB domains which will act independently like the GEBs on the GE2/1 modules

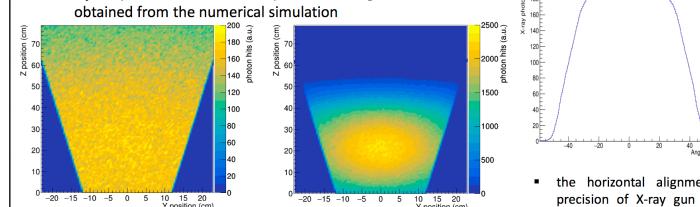

## New approach to the rate capability study

Due to the **non-uniform irradiation**, each HV sector receives a **different photon flux**.  
1) a dedicated **numerical simulation** was developed to estimate the **HV sector weights  $w_i$** :

→  $w_i$  is the fraction of total current flowing through the protection resistor of the  $i$ -th HV sector (in case of non-uniform irradiation)

→  $w_i$  is equal to fraction of total photons hitting the  $i$ -th HV sector obtained from the numerical simulation

2) the **HV sector weight  $w_i$**  is calculated as follows:

$$w_i = \frac{\text{current on the } i\text{-th HV sector}}{\text{total current on foil}} = \frac{\text{photon hits on } i\text{-th HV sector}}{\text{total photon hits}}$$

Francesco Fallavollita

GEM Phase 2 Upgrade Workshop

- the horizontal alignment precision of X-ray gun ~1 cm gives uncertainty on the HV sector weights
- the error propagation give an uncertainty of ~0.2 on the gas gain drop

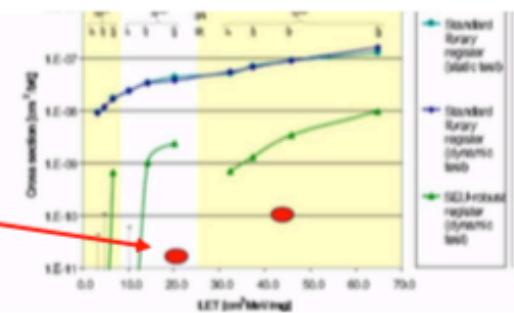

CERN, May 19<sup>th</sup>, 2020

# GEM VFAT3 irradiation

- In November 2019 VFAT3 was irradiated with Heavy Ion Beam to measure SEU x-sections:
  - Slow Control Register
  - SRAM memory

LET [MeV/(mg/cm <sup>2</sup> )]	Ion	run dose [rad]	mean flux [i/cm <sup>2</sup> s]	reached fluence [i/cm <sup>2</sup> ]	elapsed time[sec]	Cross section(cm <sup>2</sup> )
20.4	Ni	979.2	9585	3000051	313	$5.4 \times 10^{-11}$
46.1	Rh	7382.3	15028	10008557	666	$1.6 \times 10^{-10}$

Comparison with standard FF

- Good news:
  - SEU x-sections are very small
- Bad news:
  - Observed unexpected losses of synchronization
- Reminder:
  - All logic inside VFAT3 is implemented using TMR.
  - All FF outputs are voted using three independent voters and the three voters outputs are feed back to the three FF. The result is that every clock cycle FFs are updated with the corrected value.

⇒ Planning a new irradiation test at Louvain asap

# Upgrade and maintenance in LS2: Muons define critical path

## Main Muon activities

- CSC inner ring electronics upgrade
- GE1/1 detector + services installation
- GE2/1, RE3/1, RE4/1 services pre-installation

DT Phase 2 sector test

# Da aggiornare

LS2 muon maintenance activity timeline for Run 3

DT : shielding (reduce n background) + maintenance access to wheels (for -1, 0, 1, first since LS1)

RPC: major leak suppression campaign as part of CERN greenhouse gas reduction strategy

## Endcap mu phase 2 upgrade: stations GE2/1 and RE3/4-1

LS3 logistics (simultaneous Tracker, Calorimetry & barrel Muon upgrade)

----> severely limits station 2-4 access windows

----> **thereafter make best use of opportunities for installation in Run 3 (E)YETS**

----> completion of services installation in LS2 is a central priority → ON-GOING

Aim is to assure installation and commissioning completed for early in Run 4 at the latest.

**New HL-LHC schedule will be agreed in fall 2019 between experiments and CERN**

# CMS Muon milestones 2019

DT prototype electronics (Minicrate and back-end) validated (HM) (TDR reference DT.RD.FE.5, DT.RD.BE.4)

Ottobre 2019 - In progress, installazione sul detector iniziata il 2 luglio come da schedule

fase2

DT Completamento analisi performance run2

100%

RPC Prosecuzione studi di ageing sulle camere irraggiate alla GIF++

Dic 19  
in corso 70%

RPC Power system : validazione prototipi

Dic 19  
Prototipo ordinato - In attesa di iniziare il test.

fase2

iRPC pre-produzione completata e validata

Dic19  
Probabile slittamento per ritardo nella validazione della FEB

fase2

RPC Completamento analisi performance run2

100%

Completa caratterizzazione primo prototipo GE2/1 full size (M1+M2+M3+M4)

50%

fase2

GE1/1 Completamento dei servizi del sistema di potenza

100%
