# On the detectability of cosmogenic neutrinos

*Monday, 22 February 2021 11:00 (20 minutes)*

Ultra-high-energy cosmic rays (UHECRs) interact with pervasive photons during propagation. These interactions produce neutrinos, which can provide valuable insights on the elusive sources of UHECRs as well as on the composition of the highest-energy radiation. In this talk I will present realistic predictions for this cosmogenic flux, obtained through fits to UHECR measurements. In light of these results, I will discuss the prospects for detecting cosmogenic neutrinos with current and next-generation neutrino telescopes.

## Collaboration name

**Primary author:** ALVES BATISTA, Rafael (Radboud University)

**Presenter:** ALVES BATISTA, Rafael (Radboud University)

**Session Classification:** Astrophysical Models

**Track Classification:** Neutrino Telescopes and Multimessenger
