The Pacific Ocean Neutrino Explorer

Tuesday, February 23, 2021 6:10 PM (20 minutes)

Every time researchers have pushed the energy boundary in particle physics we have found something new about our Universe. Recently, IceCube has demonstrated that Neutrino Telescopes can use neutrinos from the cosmos as excellent tools to continue this exploration. The Pacific Ocean Neutrino Explorer (P-ONE) is a proposed initiative to construct one of the largest neutrino telescopes deep in the northern Pacific Ocean off the coast of British Columbia. To overcome the challenges of a deep-sea installation, we have deployed two prototype mooring lines STRAW and STRAW-b in 2018 and 2020. These provide continuous monitoring of optical water properties at a potential detector site in the Pacific. In this talk I will cover the latest results from these prototype lines and plans to deploy P-ONE off the coast of Vancouver Island.

Collaboration name

Primary author: Dr DANNINGER, Matthias (Simon Fraser University)

Co-author: DANNINGER, Matthias

Presenter: Dr DANNINGER, Matthias (Simon Fraser University)

Session Classification: New Facilities

Track Classification: Neutrino Telescopes and Multimessenger
