## Suppressed B decays at CDF

Friday, 15 October 2010 11:30 (15 minutes)

Quantities related to B decays that are strongly suppressed in the standard model may provide early indications of non-SM physics. The CDF experiment at the Tevatron collider has the world's largest heavy flavor samples and can explore rare decays with unprecedented sensitivity.

We present the first observation of  $B^0_s \rightarrow Phi mu^+ mu^-$  decays (the rarest  $B^0_s$  decays observed), a measurement of forward-backward asymmetry in  $B^0 \rightarrow Kmu^+ mu^-$  competitive with world-leading results, and the first measurement of polarization amplitudes in  $B^0_s \rightarrow Phi$  Phi decays. We also present new measurements on the following suppressed  $B^0_s$  decay modes:

 $B^0_s \rightarrow J/psi K(892)$ ,  $B^0_s \rightarrow J/psi f0(980)$ , and  $B^0_s \rightarrow J/psi K^0_short$ , all of which potentially informative on lifetime difference and CP asymmetries in  $B^0_s$  decays.
