New measurement of the B^0_s mixing phase at CDF

Wednesday, 13 October 2010 11:55 (20 minutes)

The CDF experiment at the Tevatron collider presents improved bounds on the CP-violating phase β_s and on the decay-width difference $\Delta\Gamma_s$ of the neutral B_s^0 meson system.

We use 6500 $B_s^0 \rightarrow J/\psi \Phi$ decays collected by the dimuon trigger and reconstructed in a sample corresponding to 5.2 fb^{-1} of data.

Besides exploiting a two-fold increase in statistics with respect to the previous measurement, several improvements have been introduced in the analysis including

a fully data-driven flavor-tagging calibration and proper treatment of possible S-wave contributions.
