CI and CD on K8S @ CNAF

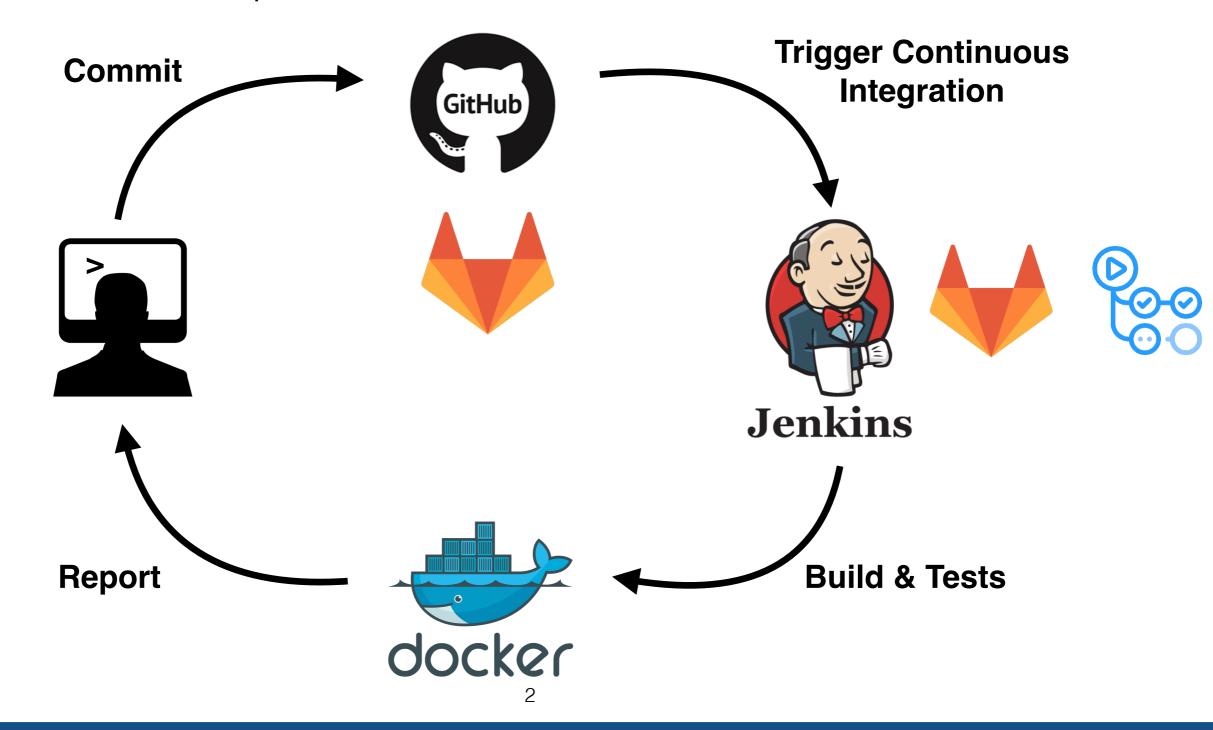

Andrea Ceccanti andrea.ceccanti@cnaf.infn.it

Corso OLSS 2021

What I will talk about?

Our experience in developing a CI and (almost) CD pipeline for the middleware development team @ CNAF

Why CI and testing?

I DON'T ALWAYS TEST MY CODE

BUT WHEN I DO, IT'S ALWAYS IN PRODUCTION

DIYLOL.COM

CI/CD = Process + Tools (+ Perseverance)

Process is harder to get right than a working CI/CD pipeline

- overkill process kills productivity, bores everyone to death and does not improve the quality of delivered code
- sloppy process only introduces overhead without quality improvements

The hardest thing to change is the developer attitude

• testing is **more important** than coding

Processes are **improved incrementally**, in small steps

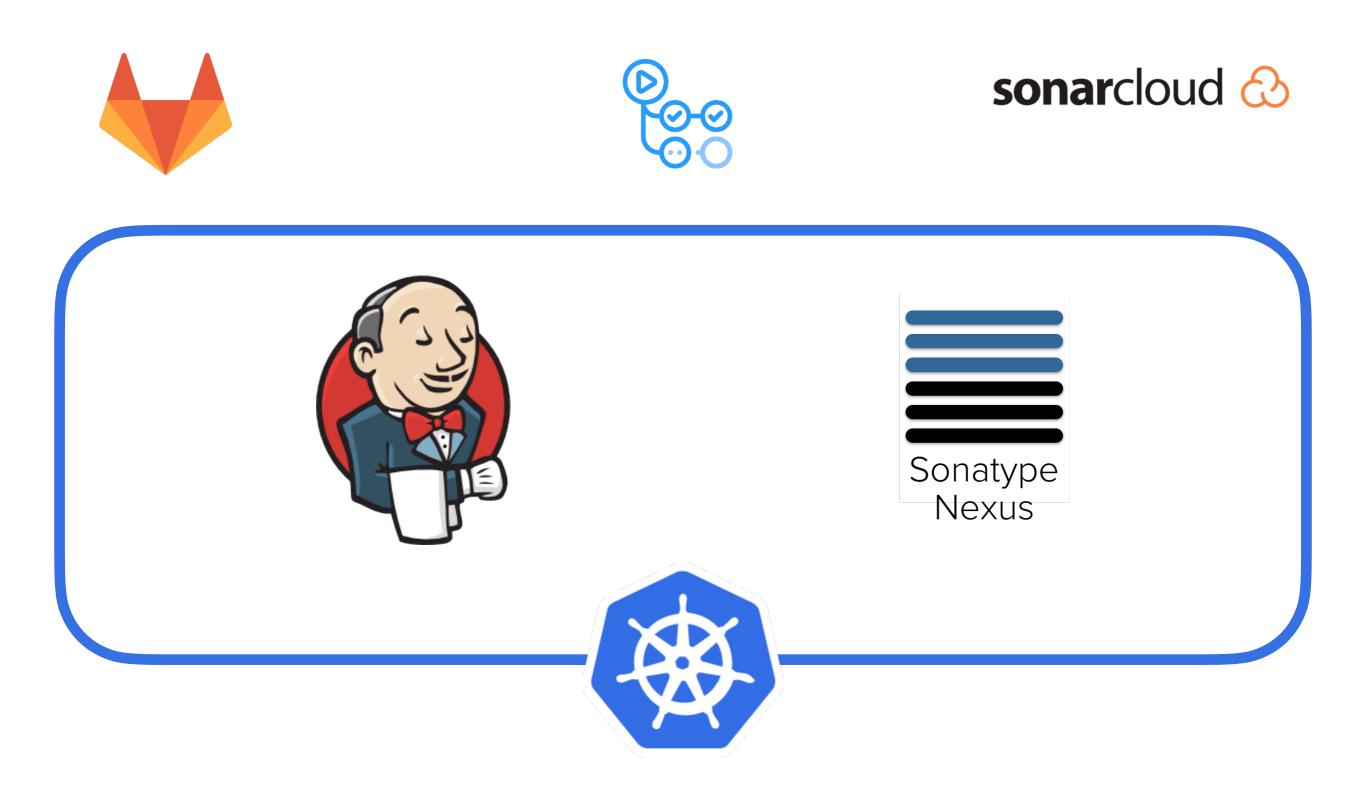

• especially for legacy codebases that mostly work fine in production

Tools are **learned incrementally**, in small steps

• it can take years to learn how develop and maintain an effective CI/CD pipeline

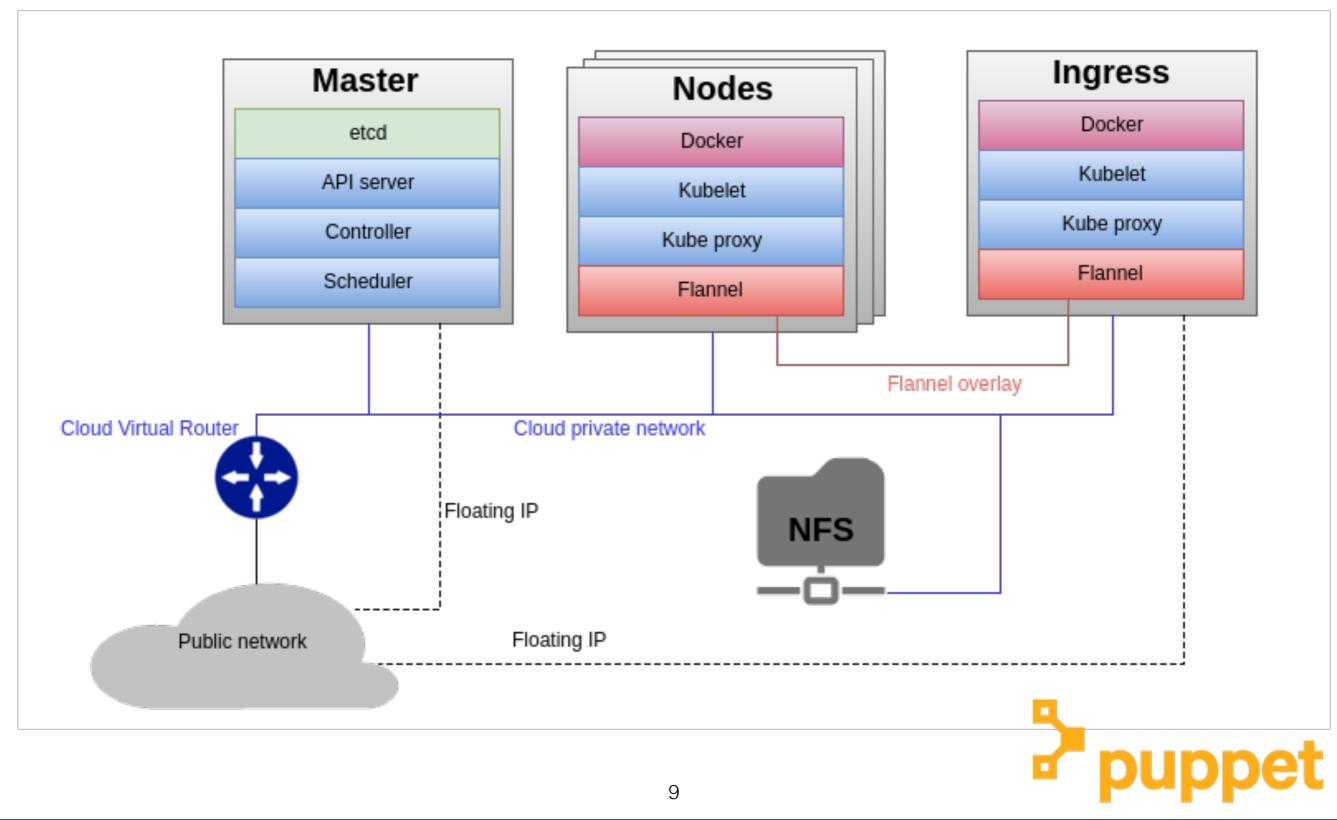

CI/CD infrastructure

Our CI/CD infrastructure

The K8S infrastructure

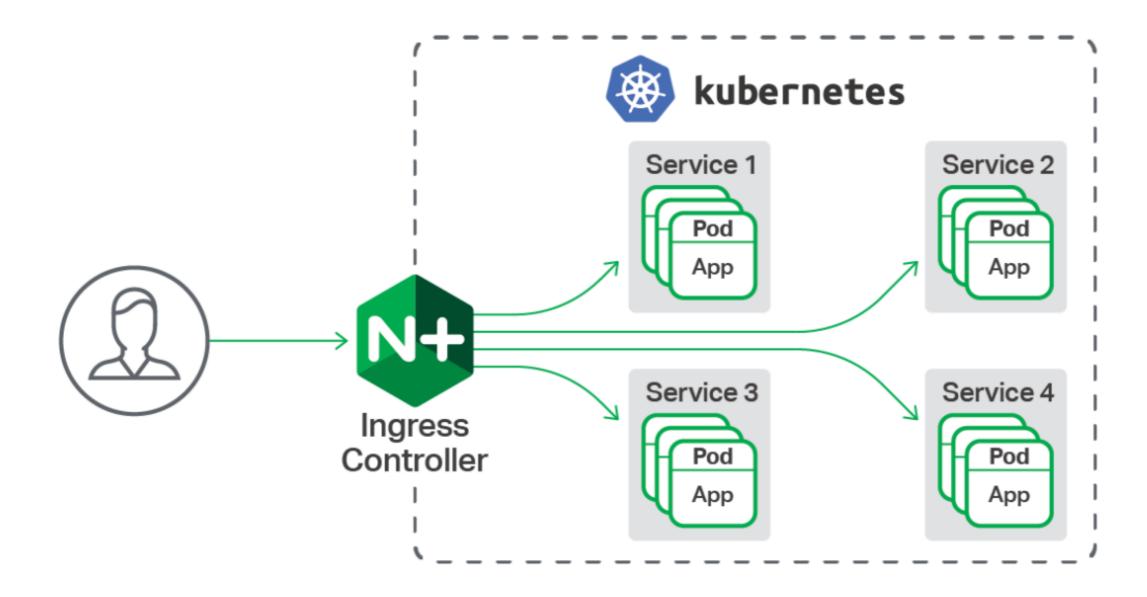

The K8S ingress controller

Allows access to K8S services from the external network

Deployed as a service inside the K8S cluster itself

Example ingress controller config

1	apiVersion: extensions/v1beta1
2	kind: Ingress
3	metadata:
4	name: jenkins
5	spec:
6	tls:
7	- hosts:
8	- ci.cloud.cnaf.infn.it
9	<pre>secretName: jenkins-ssl-secret</pre>
10	rules:
11	- host: ci.cloud.cnaf.infn.it
12	http:
13	paths:
14	– path: /
15	backend:
16	serviceName: jenkinsci
17	servicePort: 8080
18	

LTS release branch running as a K8S application

Slaves provisioned via the Kubernetes plugin

Jenkins Home provisioned as a persistent volume on NFS

• nightly backup

	INDIGO Identity and Access		

Nexus repository

Nexus is our CI repository

- Maven repo (local artifacts + Maven central mirror)
- Packages repository

Storage provided as a K8S persistent volume

https://repo.cloud.cnaf.infn.it/repository/indigo-iam/index.html

Indigo IAM Package Repository

This is the Indigo IAM Login Service package repository web site.

Stable repositories

These repositories hold stable, certified releases suitable for use in production.

- RHEL 7 packages (repo file)
- Ubuntu 16.04 packages (repo file)

Beta repositories

These repositories hold the latest unreleased packages.

- RHEL 7 beta packages (repo file)
- Ubuntu 16.04 beta packages (repo file)

Sonatype Nexus

☆

Monitoring infrastructure & services

All infrastructure nodes (VMs on Cloud@CNAF) monitored via Sensu

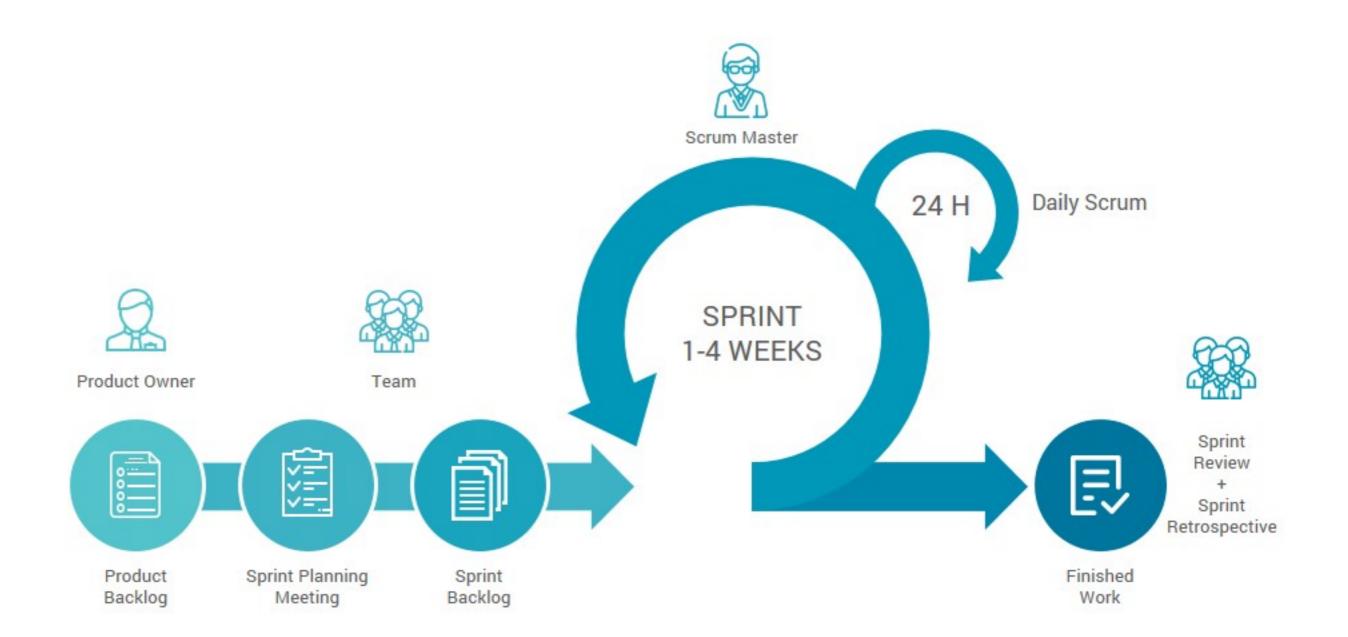

K8S monitored via Prometheus

Consistent development environment

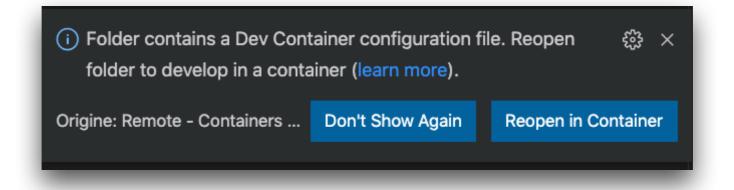

For every service, we have a docker-compose to bootstrap a selfcontained, embedded development environment

The main objective is avoiding the "builds/works on my machine" mantra

• just to replace it with "builds/works on my docker installation" mantra

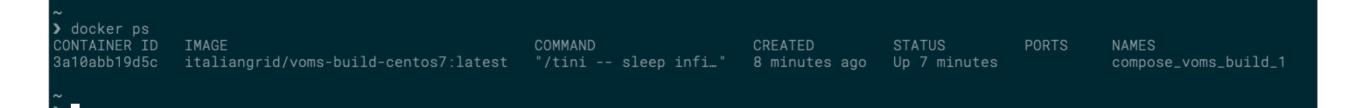

https://code.visualstudio.com/docs/remote/containers

Makes it very easy to develop inside a container

36		-	

Unit tests

• JUnit + Mockito in Java, GTest + GMock in C++, unittest in python

Integration tests

- Spring MockMVC tests
- Functionality acceptance tests
  - Robot framework-based

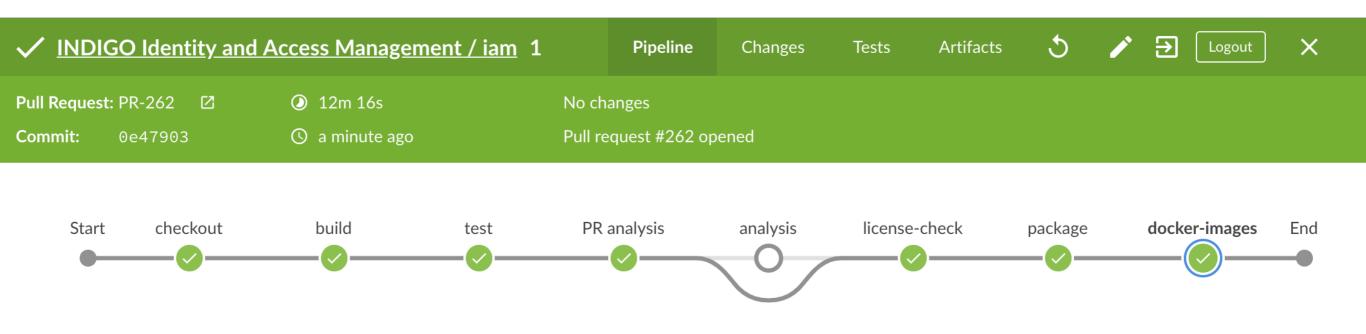

Deployment tests

 Installation from packages/docker image + run functionality/acceptance testsuite

Load tests

• Mainly based on the Grinder framework, to perform stress testing before and across releases

# Cl pipeline example: IAM

Conventional build & test process for maven-based Spring application

• with additional SonarQube static analysis in the middle

The main artifacts of the build are docker images

• pushed to Dockerhub (for some branches)
