

Status of CGEM Tracking

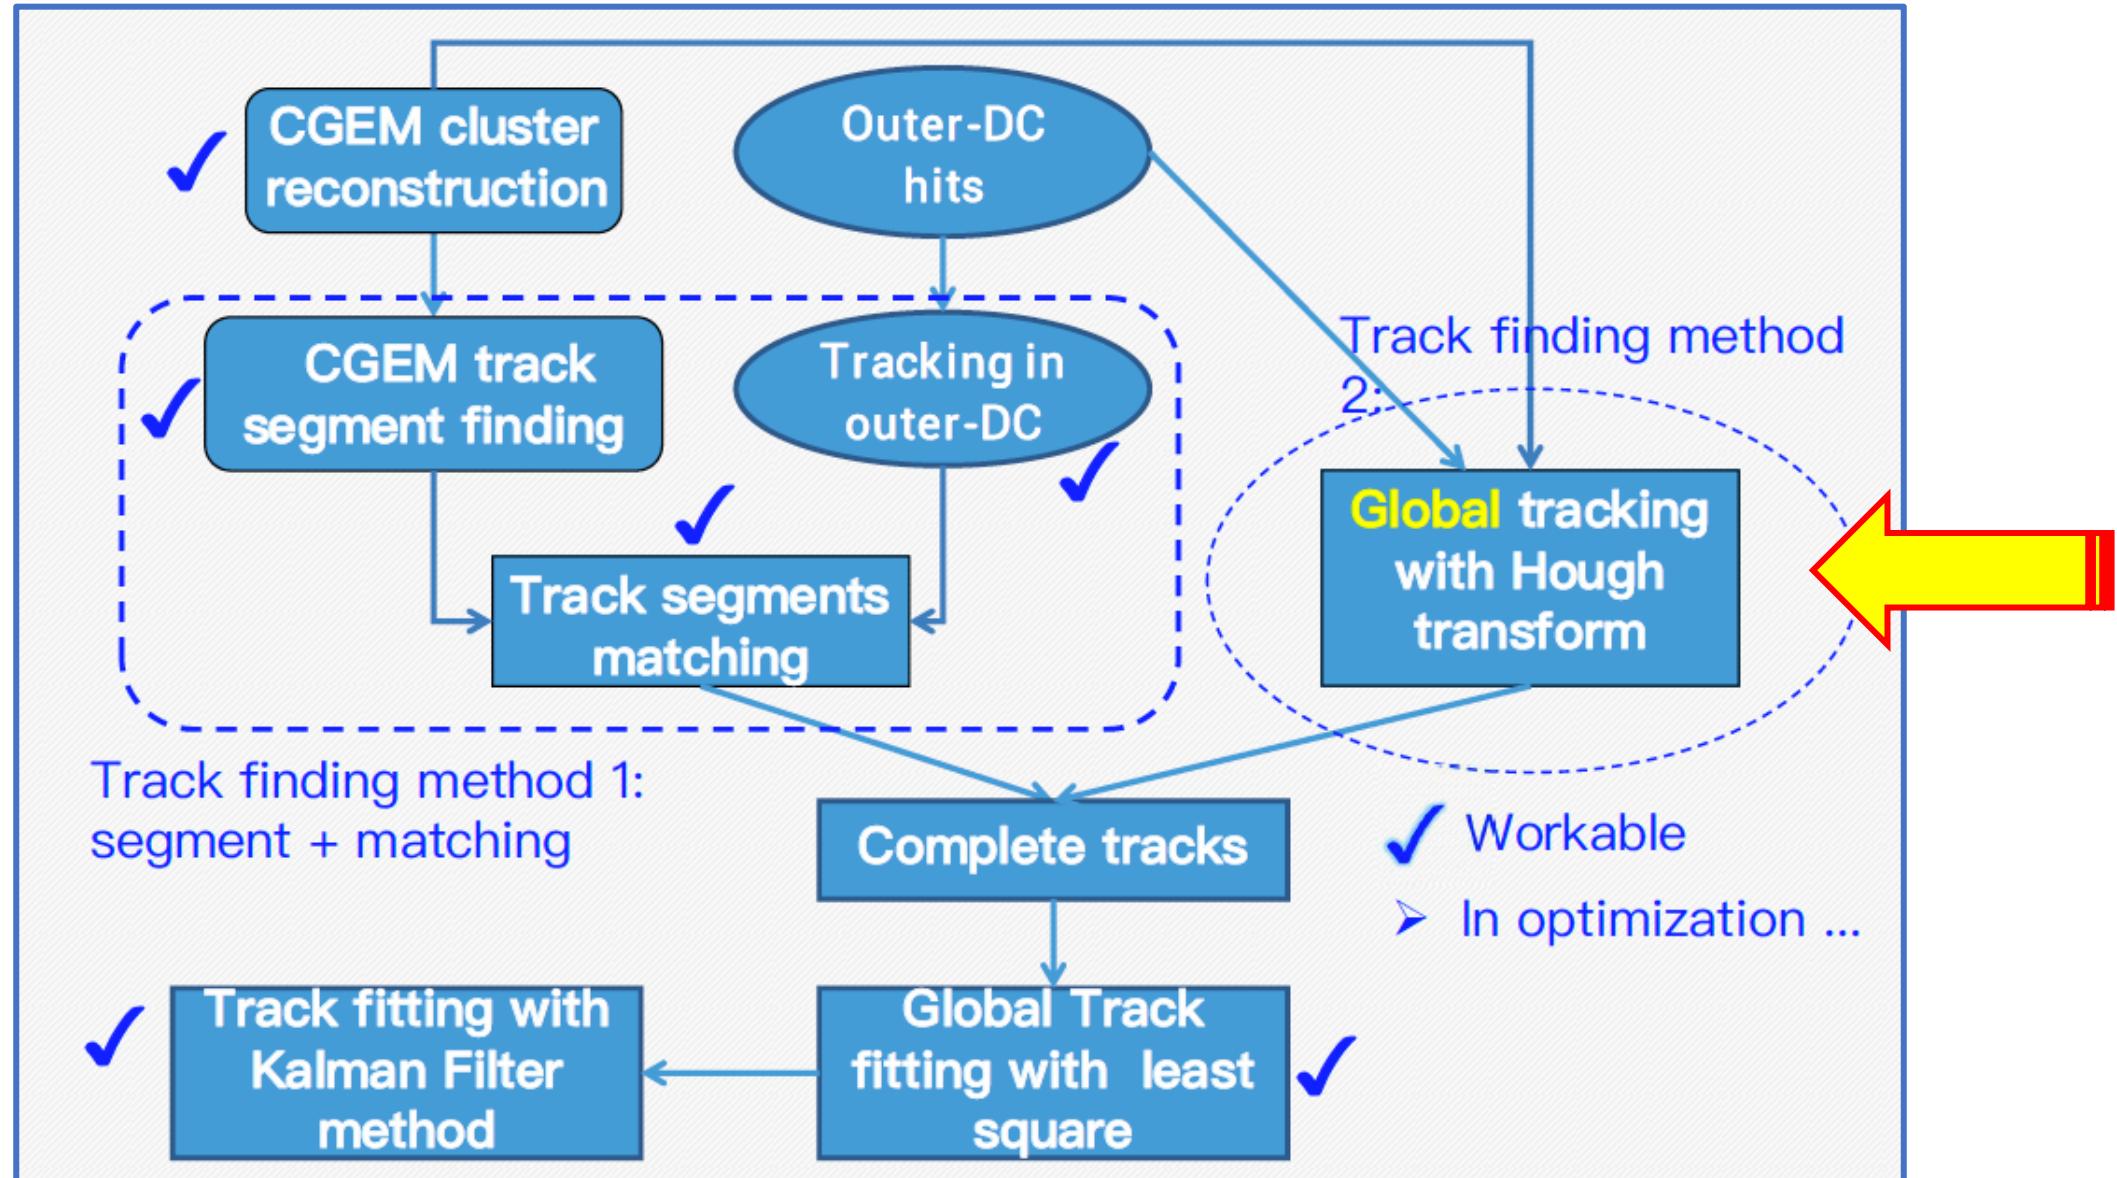

Stefano Spataro

6th November 2020

Global Reconstruction

A che punto è la notte?

Global Hough Algorithm

- Global Hough transform algorithm: no news since about one year
 - a working version of the packages should be provided before the Spring Festival (January 2020)
 - COVID-19 ==> we lost any news from Huang Zhen
- EB meeting on April 29, 2020
 - Find the last working version uploaded by Huang Zhen to the ihep account
 - Upload it before May 13
 - Increase the manpower
 - Long Li (40%) (3~5 months)
 - Yao Zhong (20%)
 - Lia Lavezzi and Isabella (mainly on test and check)
- May 11, 2020
 - **HoughTransfAlg00-00-14 (CgemBoss)**
 - **TrkFitter-00-00-13 (CgemBoss)**
 - **TrackUtil-00-00-12 (Boss)**

Isabella, al BESIII-Italia di Giugno

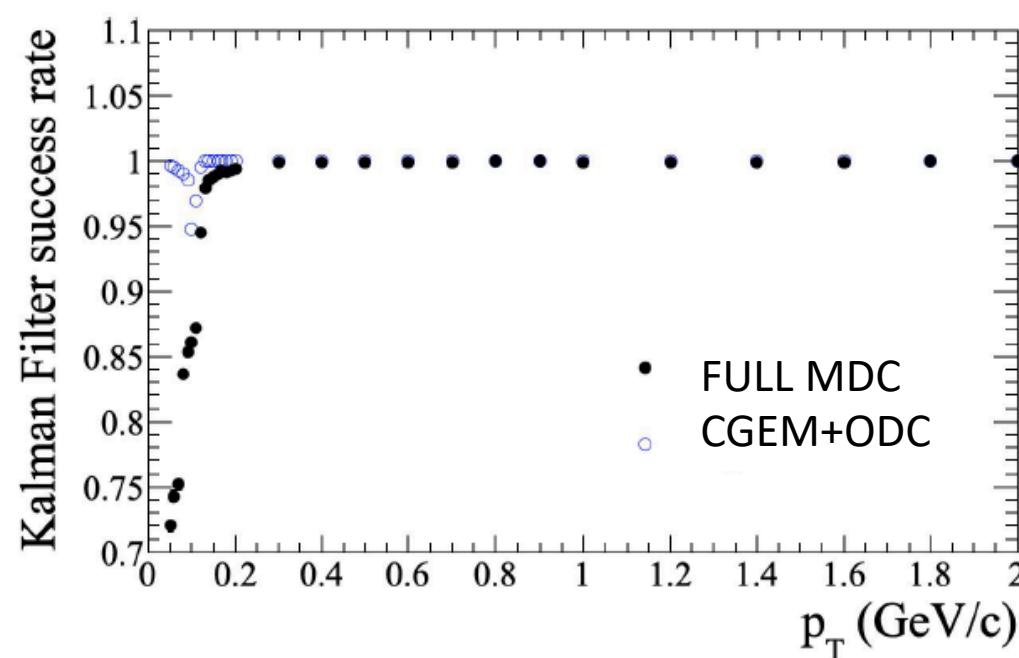

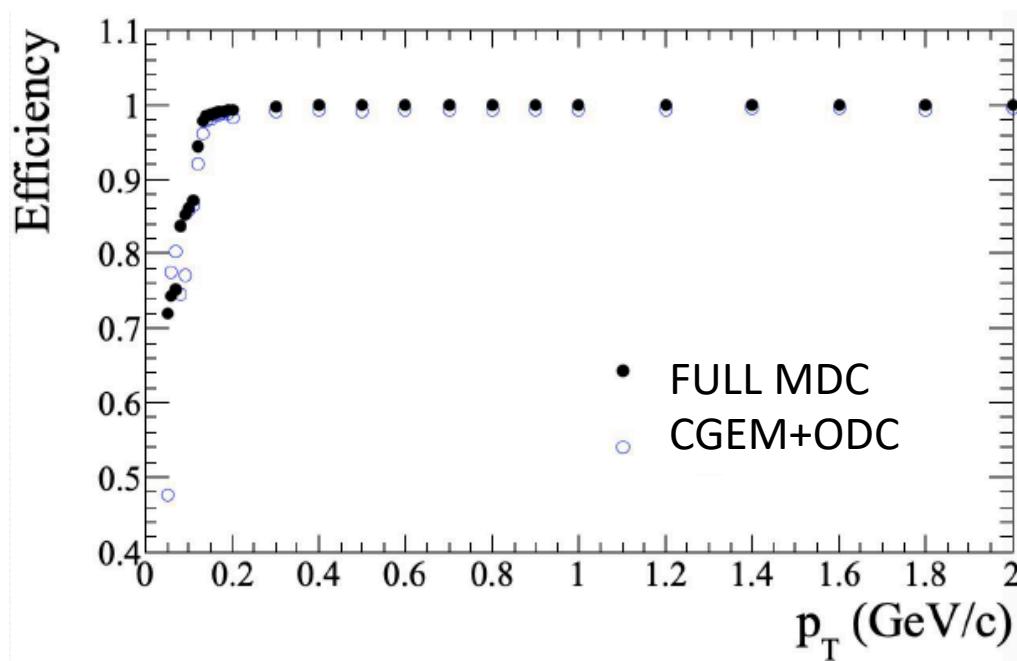

Global Reconstruction

We missed the developer, but we are able to use the code!

What is ongoing:

- Code testing, debugging and improvements(?)

Single muons, “new” results, comparison with full MDC

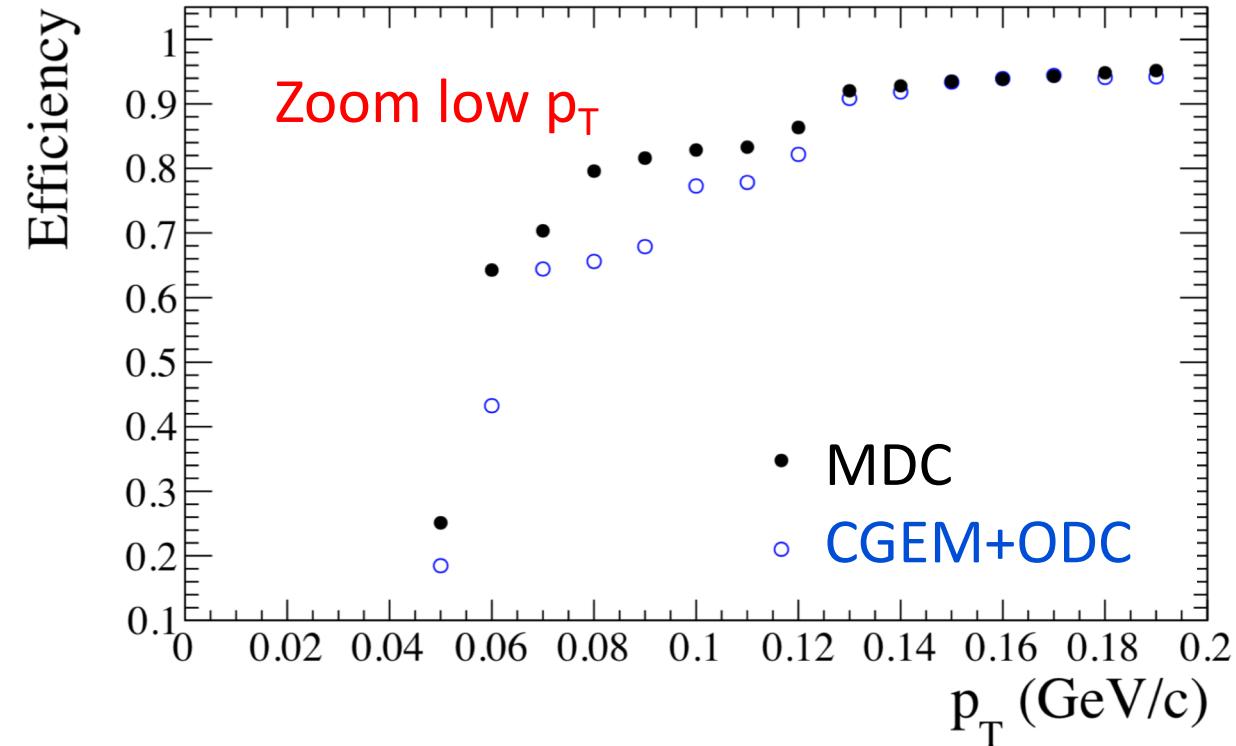

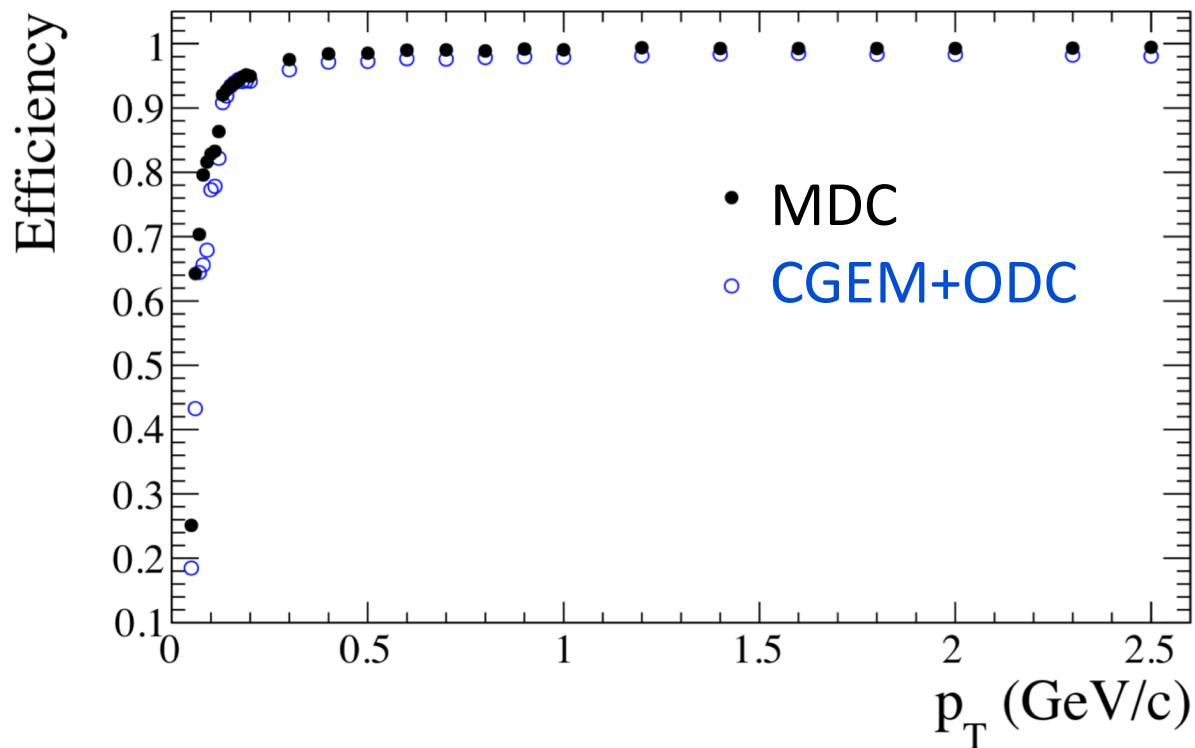

Global Tracking Characterization

Single pion Efficiency

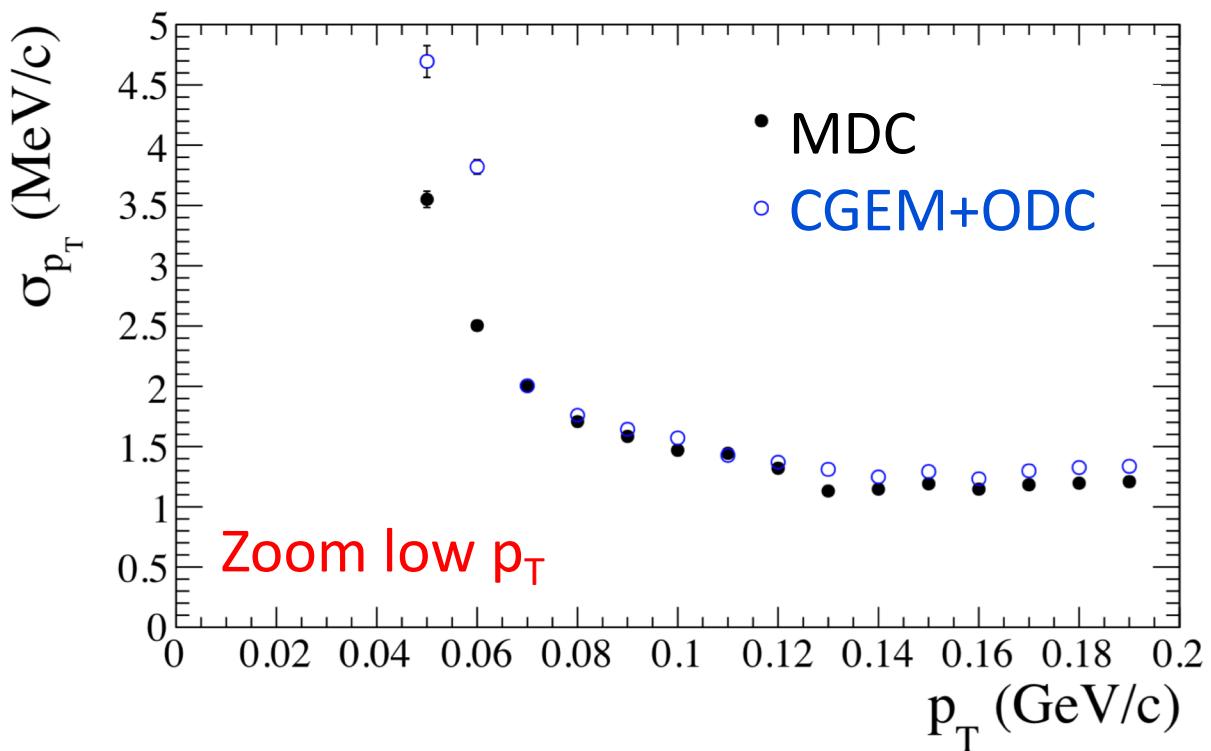

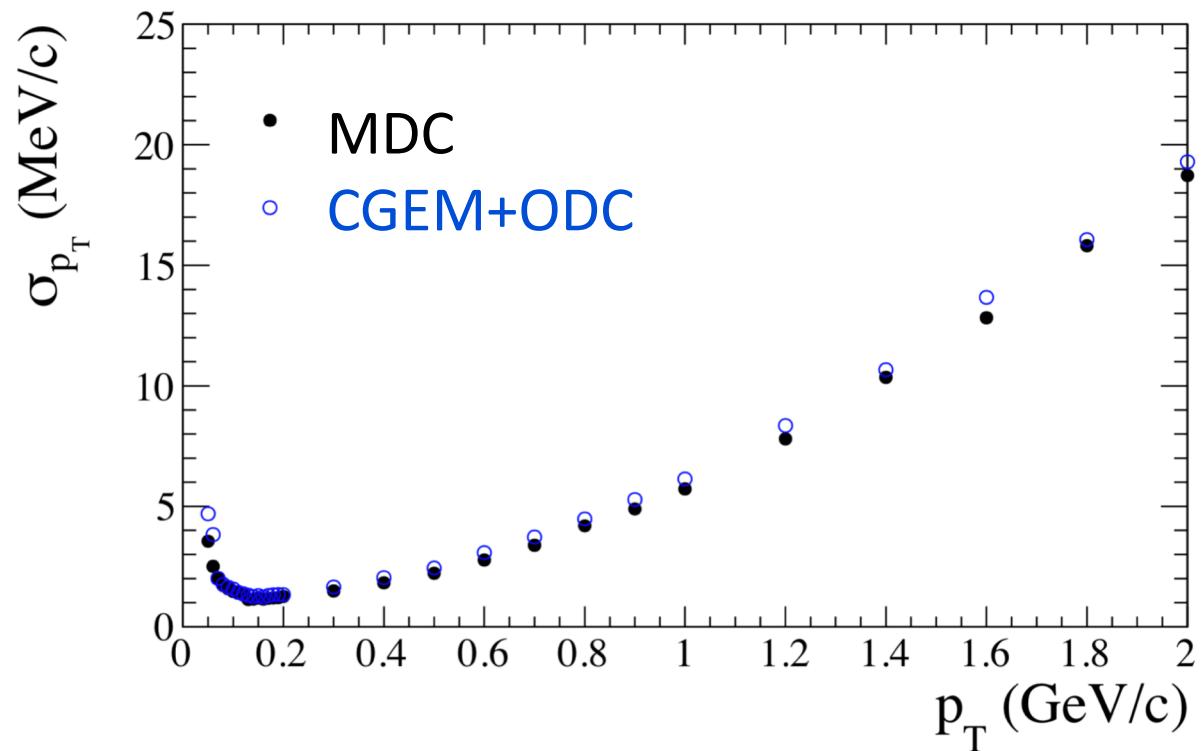

Efficiency comparable to MDC case, a bit lower at low p_T , there is room for improvements

Global Tracking Characterization

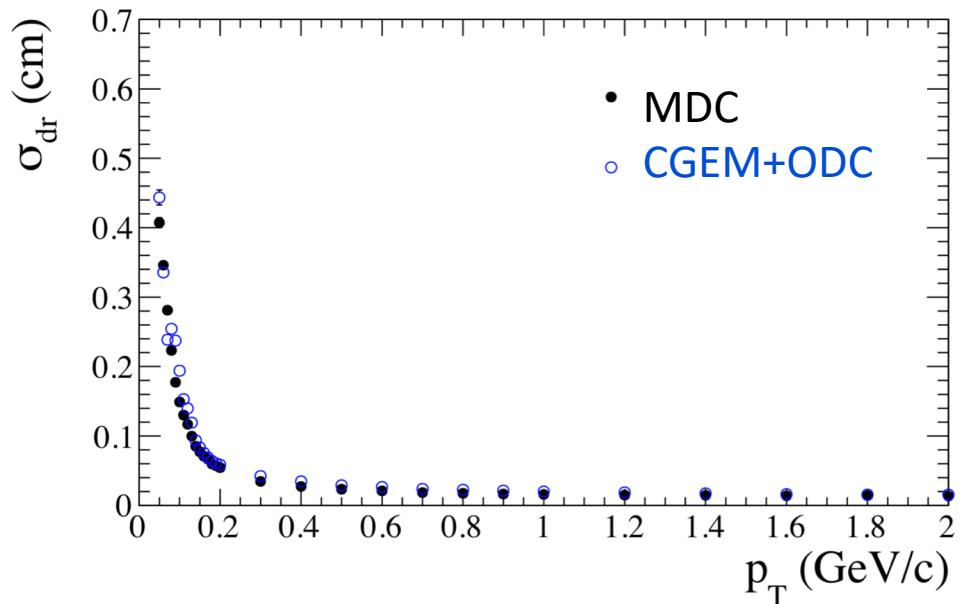

Single pion Momentum Resolution

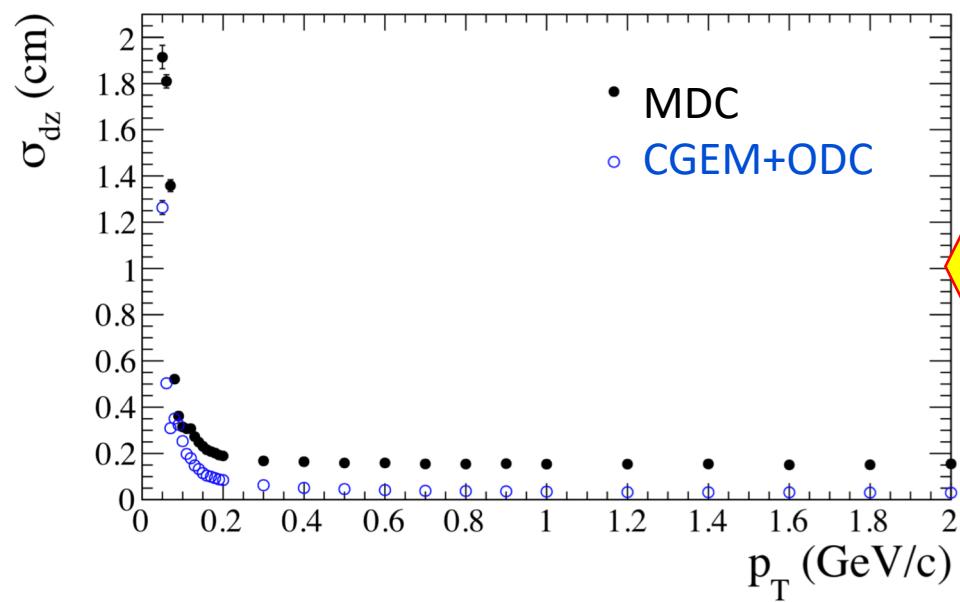

Resolution comparable to MDC case, a bit worse at low p_T , there is room for improvements

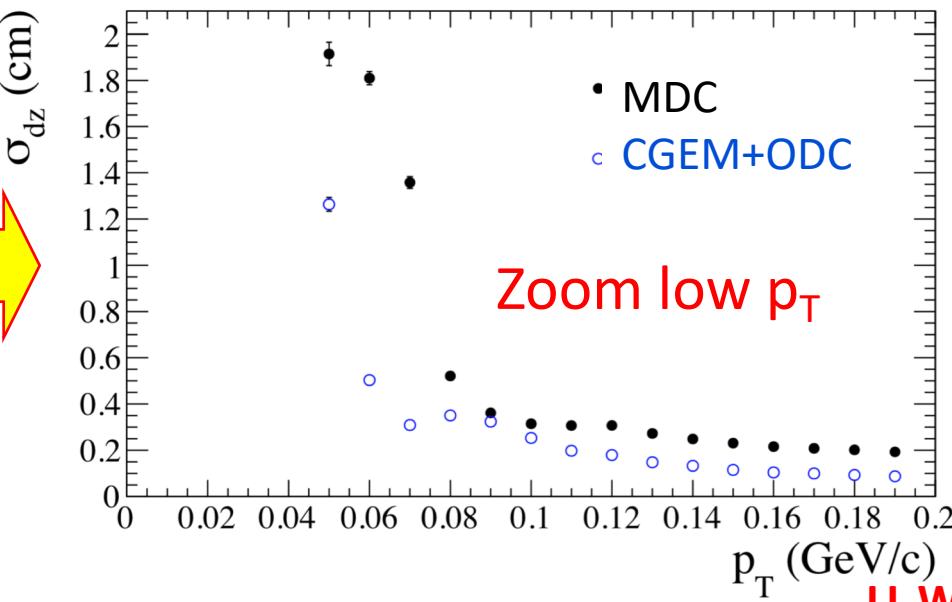

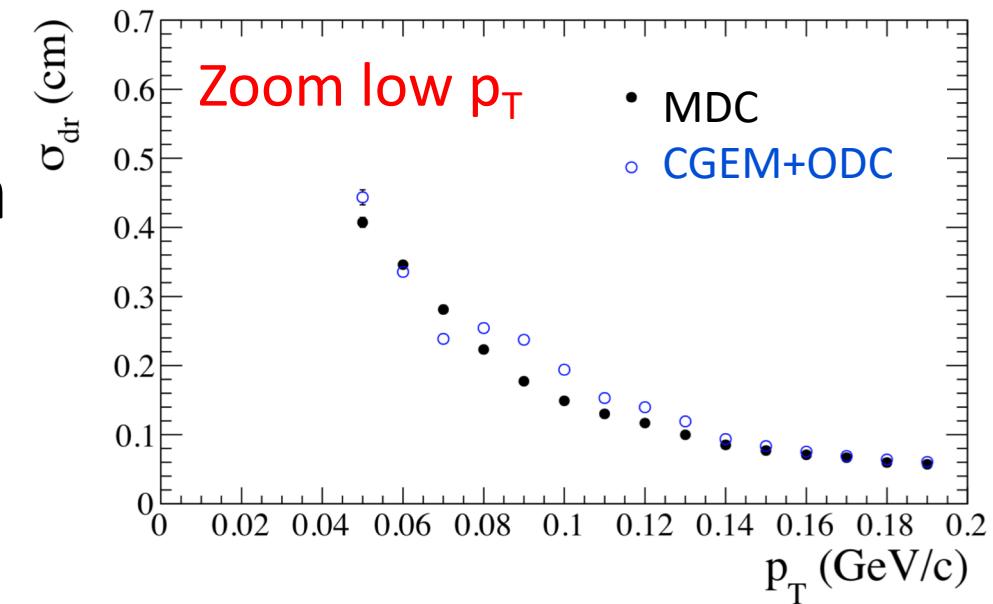

Global Tracking: Vertexing

Single pion

Much
Better
!

Global Reconstruction - II

- We need to better understand the code at higher multiplicities
- More performance checks

$\psi(3686)\pi^+\pi^- \rightarrow \text{J}/\psi \rightarrow \pi^+\pi^- e^+e^-$

Event selection flow	FULL MDC	1 st Hough Import	Hough after fixes
Ntrack>=4	75.89%	(69.81±0.46)%	(69.09±0.46)%
$\pi^+ + \pi^- + e^+ + e^-$ selection ①	59.76%	(52.80±0.50)%	(53.55±0.50)%
Loose J/ ψ mass cut ②	57.50%	(50.11±0.50)%	(50.86±0.50)%
4C fit($\chi^2 < 60$)	38.19%	(26.14±0.47)%	(32.08±0.47)%

① $\pi^+ + \pi^- + e^+ + e^-$ selection: PID by momentum, $p < 0.8 \text{ GeV} \rightarrow$ pion, $p > 0.8 \text{ GeV} \rightarrow$ electron, $|dr| < 1.0 \text{ cm}$, $|dz| < 10 \text{ cm}$, $|\cos\theta| < 0.93$, total charge = 0

② Loose J/ ψ mass cut: m_{ee} in $(2.5, 4.0) \text{ GeV}/c^2$, $m_{\pi\pi\text{-recoil}}$ in $(2.5, 4.5) \text{ GeV}/c^2$, m_{total} in $(3, 5) \text{ GeV}/c^2$

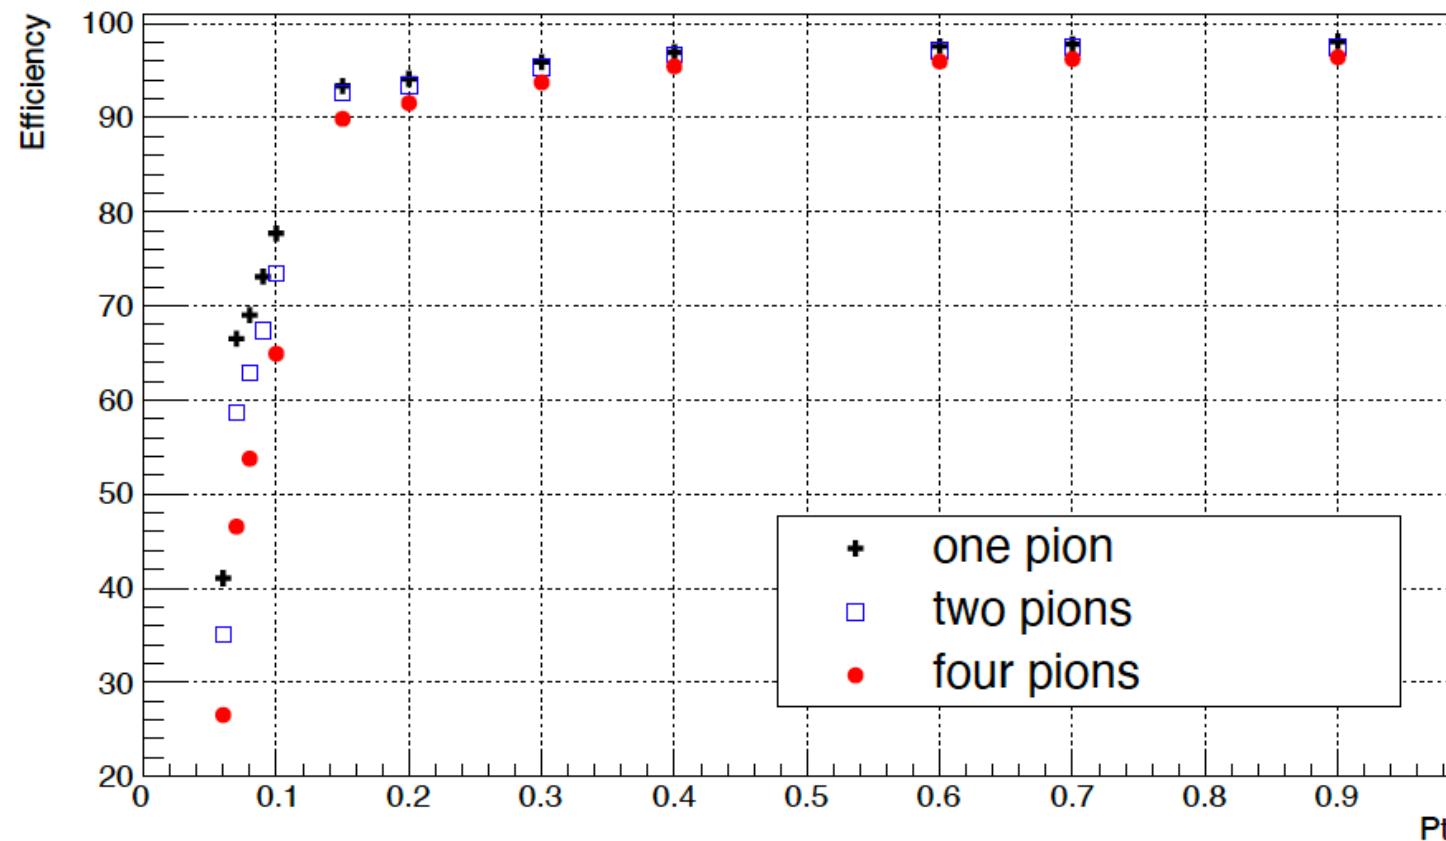

Global Tracking Characterization

Multi-pion Efficiency

(Fixed transverse momentum)

Slight decrease in efficiency by increasing the number of tracks (at percent level)

Manpower

Da parte cinese l'aumento di manpower è relativo:

- Lo sviluppatore originale non contribuisce più, nessuna informazione è stata data
- I due nuovi (Long Li e Yao Zhong) che dovrebbero lavorare sul tracciamento lo fanno sporadicamente e non seguono i meeting (ultima presentazione fatta da LL il 10/09/2020)

Da parte nostra:

- Isabella ha cominciato la caratterizzazione con eventi a molti tracce, la situazione è migliore che nella versione "antica", ma occorrono miglioramenti del codice
- Lia è ancorata al tracciamento dei cosmici, non ha ancora cominciato

Conclusions

Several activities in the past months

Global tracking code now available, released, under tests

Good single particle performances, benchmark channels must be studied

More manpower involvement would be appropriated,
but it seems Chinese activities are going into some other tasks
