

Head-Tail and directionality: Slice sorting

Samuele Torelli

Asymmetry as Head-tail measurement

- Cut the track into two pieces with same number of Slices
- Compute the integrals A and B.
- Define the Asymmetry as $(A-B)/(A+B)$
- Asymmetry multiplied times -1 if A is on the left (Sc_xmin+Sc_xprof)

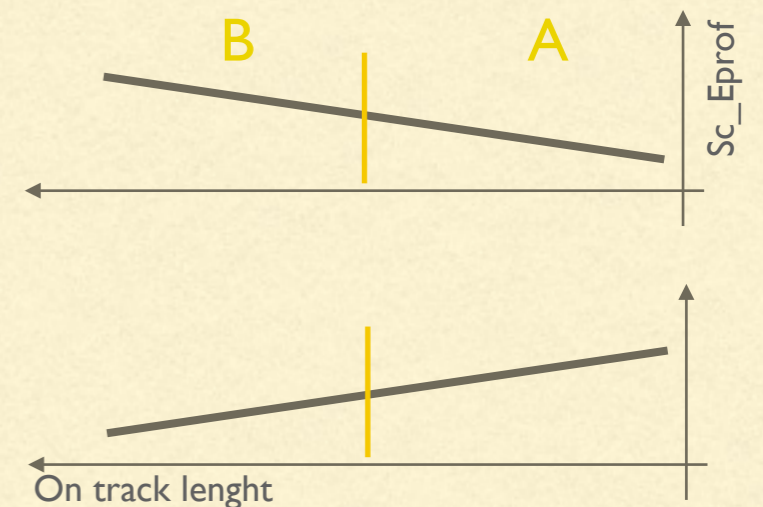

3 slices $Asimm > 0.9$

$Asimm < 0$

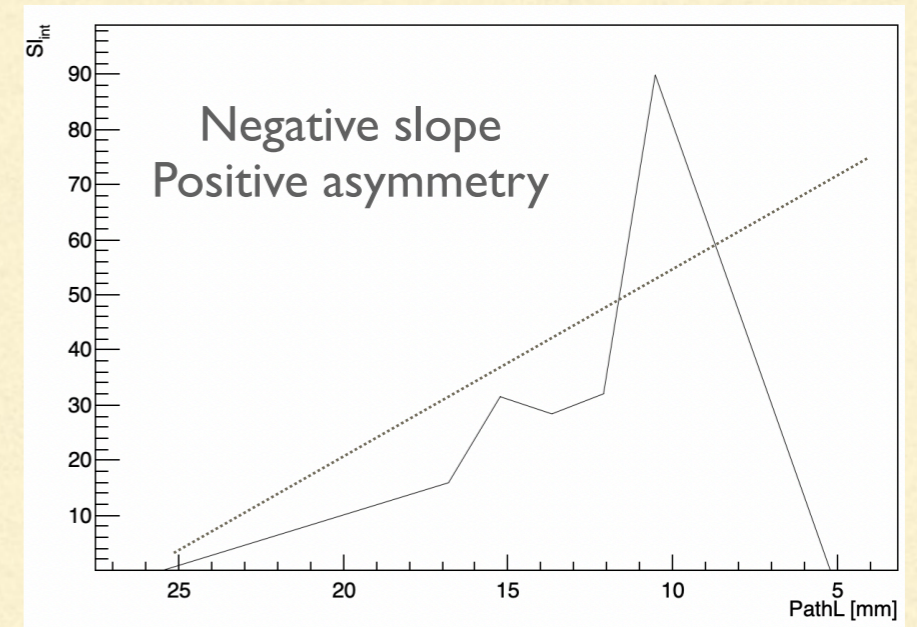

5 slices $-0.2 < Asimm < 0.2$

$Asimm > 0$
(Like above track)

Asymmetry method 2

- Fit the track profile with a line
- Slope of the track as head-tail measurement
- Multiplied times -1 if start to compute the profile from the left

Asymmetry method 3

Skewness of a distribution defined as:

$$S = \frac{\sum_{i=1}^N (x_i - \bar{x})^3}{N\sigma^3}$$

← Mean
← StDev

← Ndata

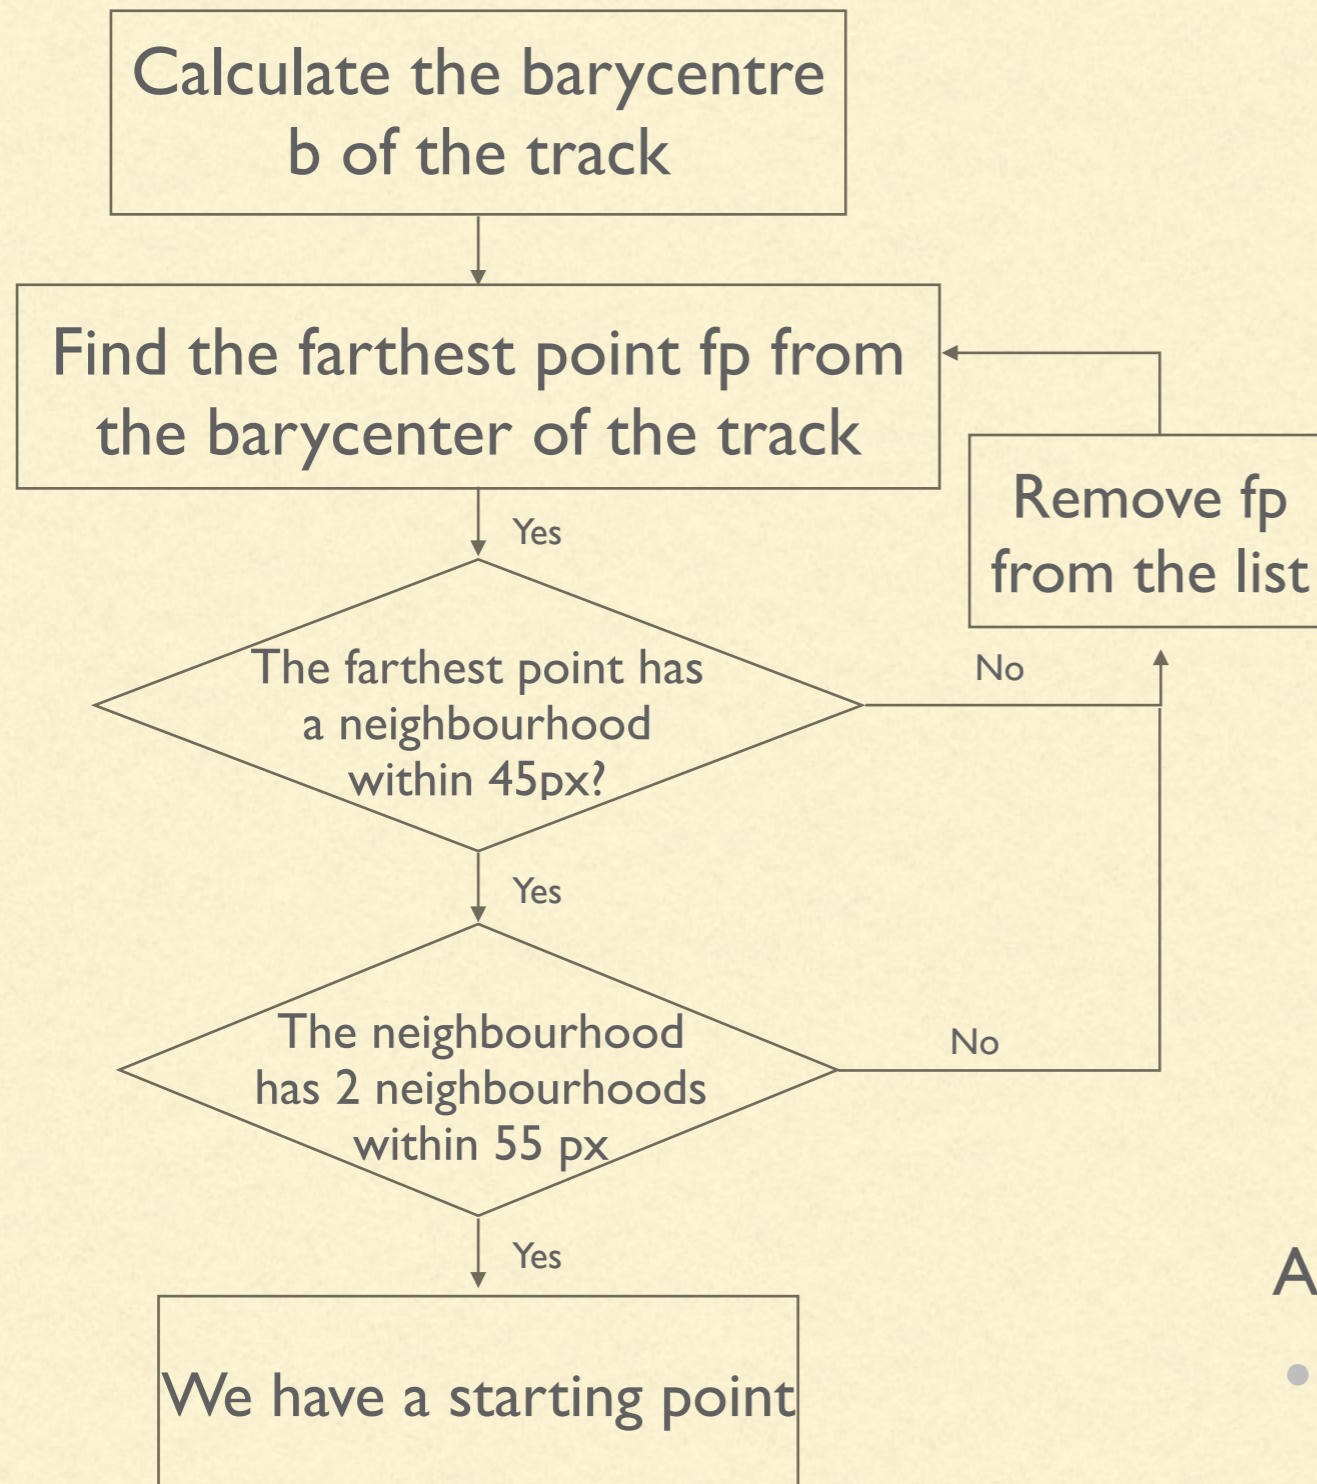

Problem in slice sorting

- Slices are sorted from top to bottom
- Asymmetries and profiles wrong

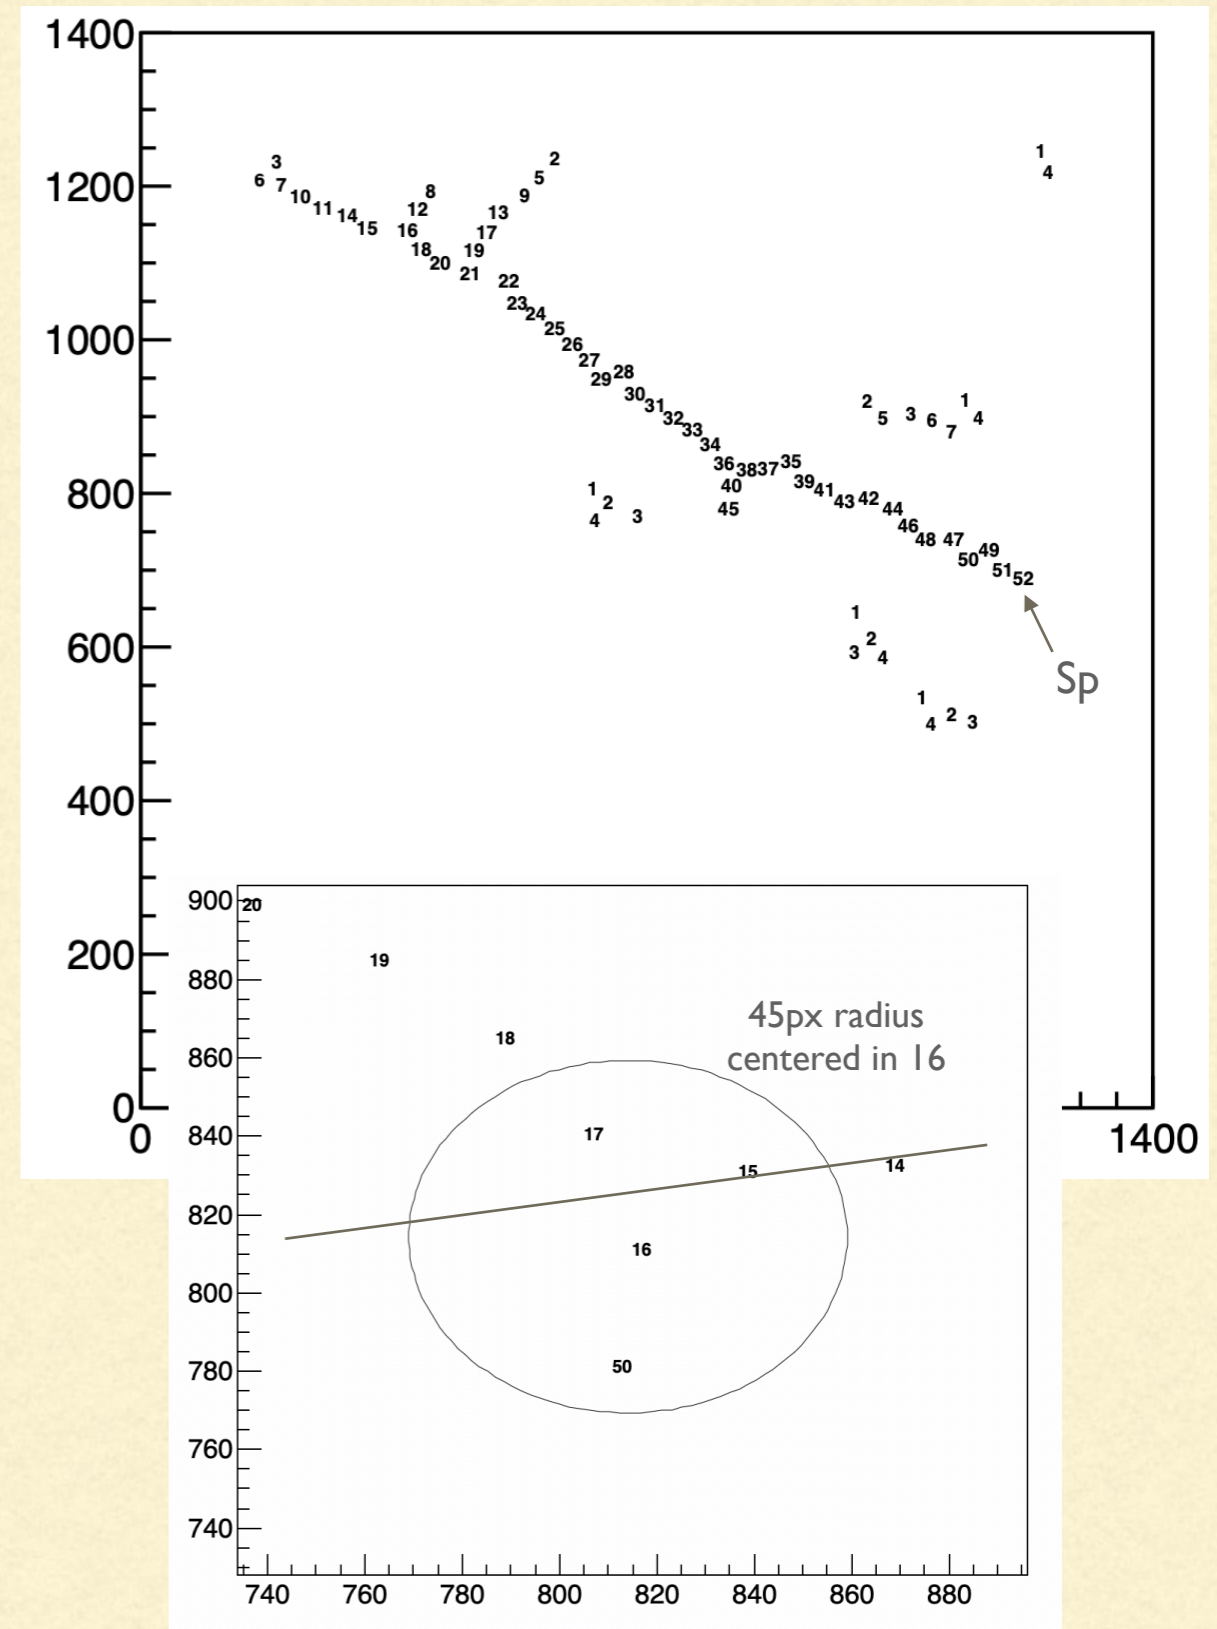

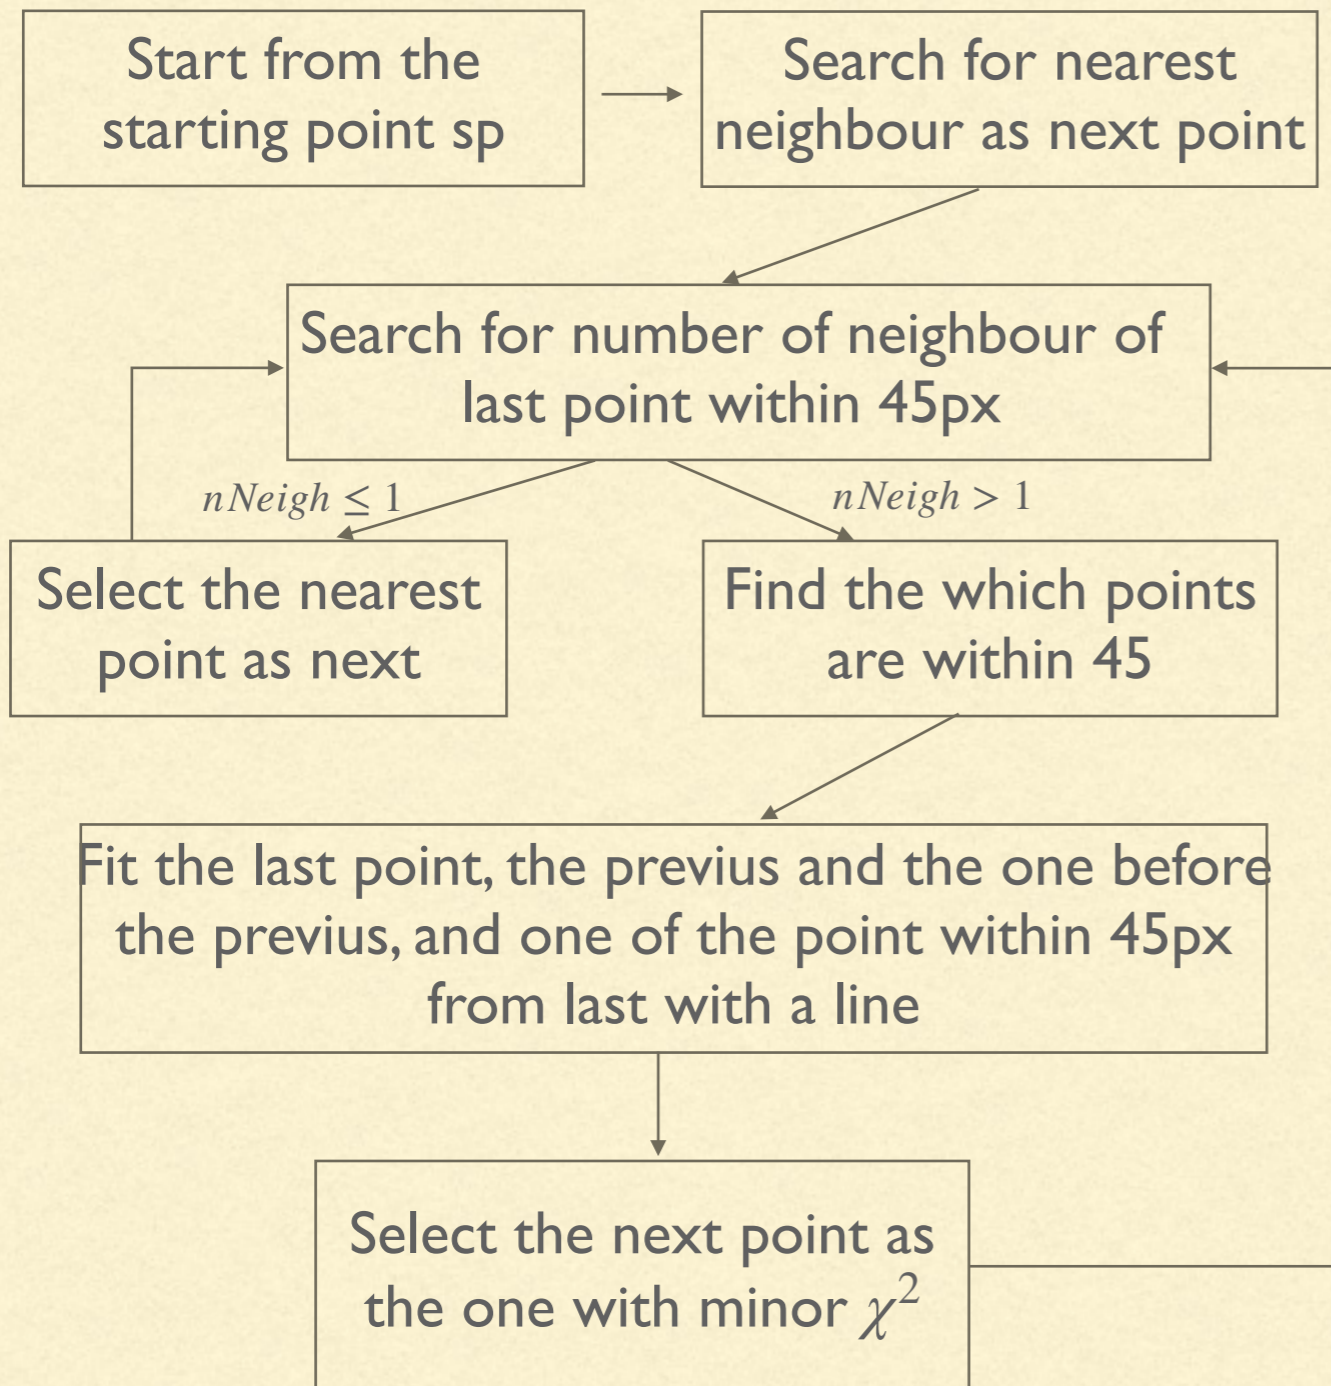

Algorithm for slice sorting: starting point

Additional advantage of fp from barycentre:

- In case of a blob (e^- head) or delta rays we'll start from the opposite side

Algorithm for slice sorting: follow the track

Algorithm for slice sorting: Final track sorted

Some optimization needed to skip delta-ray and follow the main track

Some results (and problems)

Store the information of 24-25 as delta-ray separated from the main track (useful even for curliness)

Remove outlines?
Problems in curliness,
track length and profile

Some results (and problems)

What to do with blobs? Just store the information and use it in head-tail?

On LEMON

Sorting follows the main track

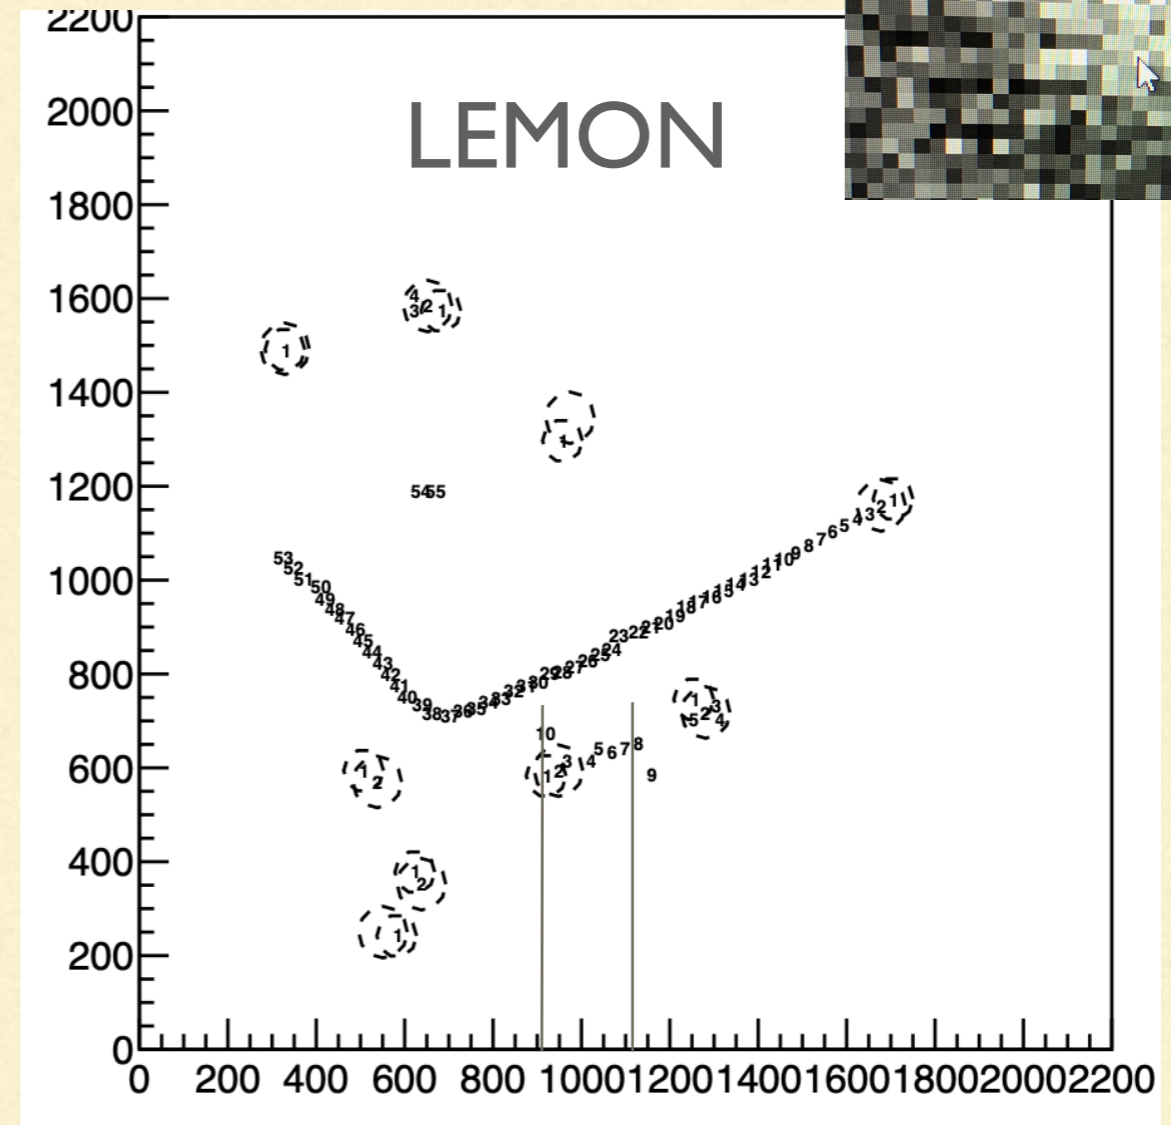

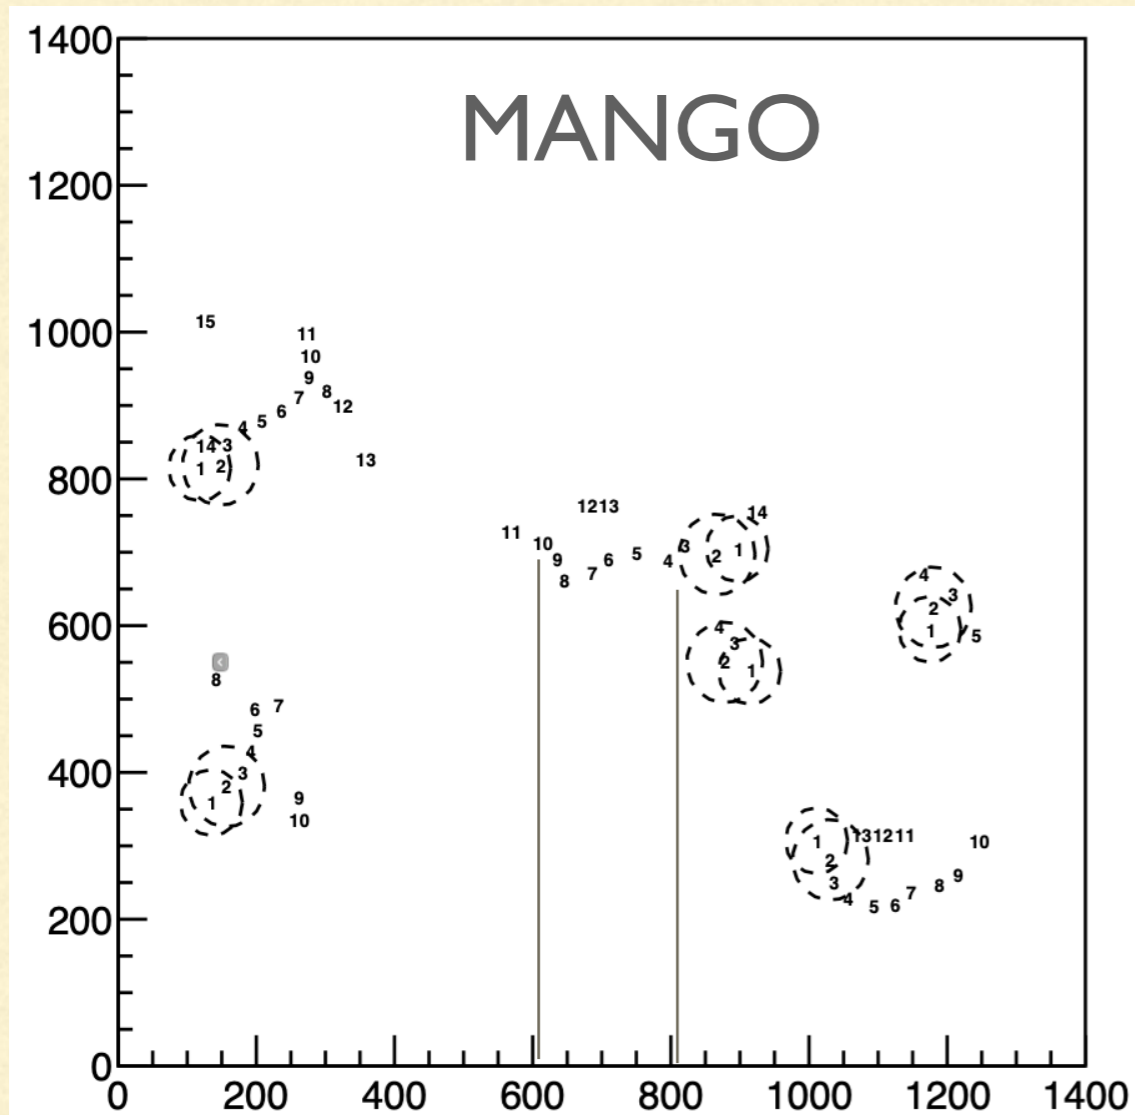

Clearer tracks: here the algorithm follows the main track

Slices in MANGO Vs LEMON

- Slices radius of 30 pixel for calibration purpose with ^{55}Fe with $\sim 125 \mu\text{m}/\text{px}$ (defined in LEMON)
- In MANGO we have $\sim 50 \mu\text{m}/\text{px}$, iron spot should be 70 pixels?

Should we increase the radius of the slices?

Conclusions:

- The head tail identification needs ordered slices to work
- A first algorithm of slice sorting seems to give promising results
- The algorithm can be optimised to separate delta rays from the main track and two overlapping track

Future work:

- Future work on main track isolation and algorithm optimisation
- Solved this point the directionality can start
