- The outer cryostat geometry was obtained from CERN group responsible for construction of the ProtoDUNE cryostat at CERN.
- Cosmogenic events(muons and secondaries) with the information (event type, energy, age, position coordinates and direction cosines) stored in a virtual cylinder of 7m radius and 14 m height. (Results from earlier FLUKA simulation through the Gran Sasso Rock.)

Sample file (C_300), $\sim 8 \times 10^5$ events (5.8×10^6 particles)
 10^7 muons at cavern ~ 169 days (normalised with respect to Borexino's muon flux measurements)

Muon event rate at cavern $\sim 3.4 \times 10^{-4} \text{ s}^{-1} \text{ m}^{-2}$

Future steps

- Addition of more statistics from Houston initial file (now we have only 169 days muon flux on the cylinder from Sagar)
- Check for physics list in GEANT4
 - a) muon-nuclear interactions – check in physics list
 - b) QGSP_BIC_HP model gives ~ 2 times more isotope yield in comparison with QGSP_BERT_HP
(3 times lower in speed).
- Comparison with the FLUKA results
- (we need the FLUKA specialist)
