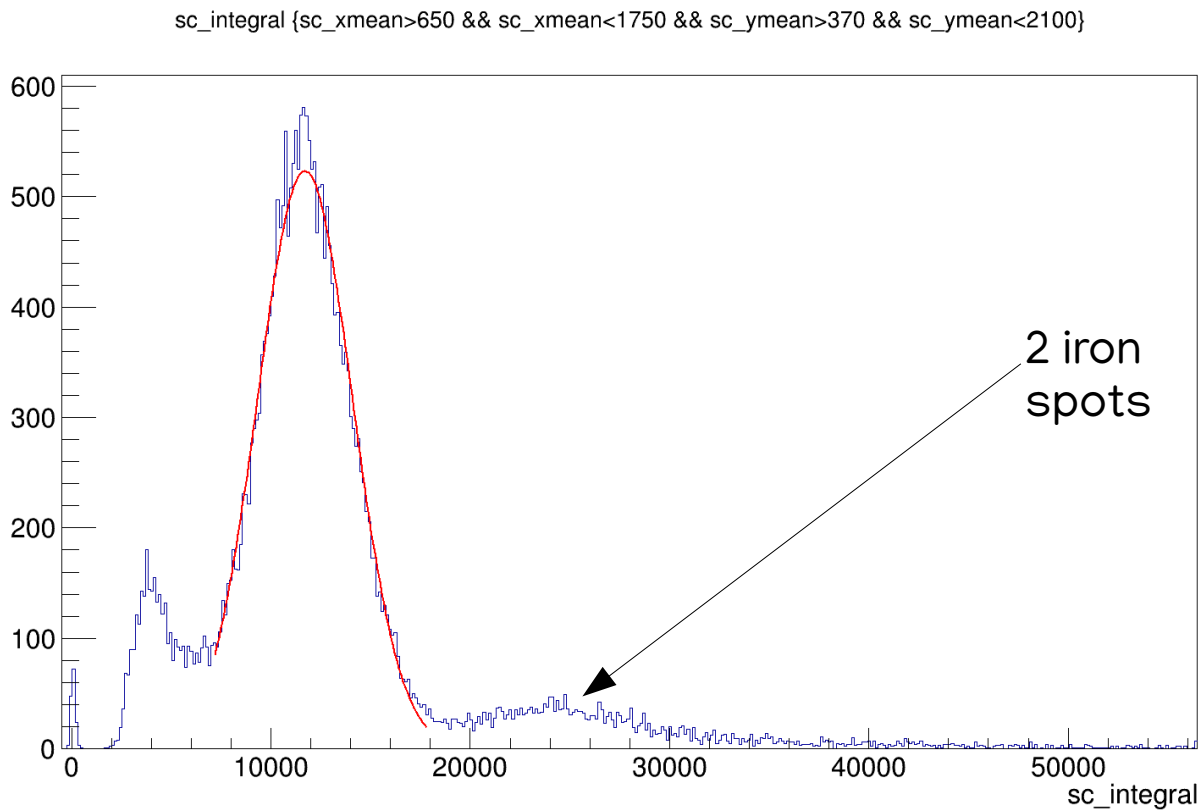
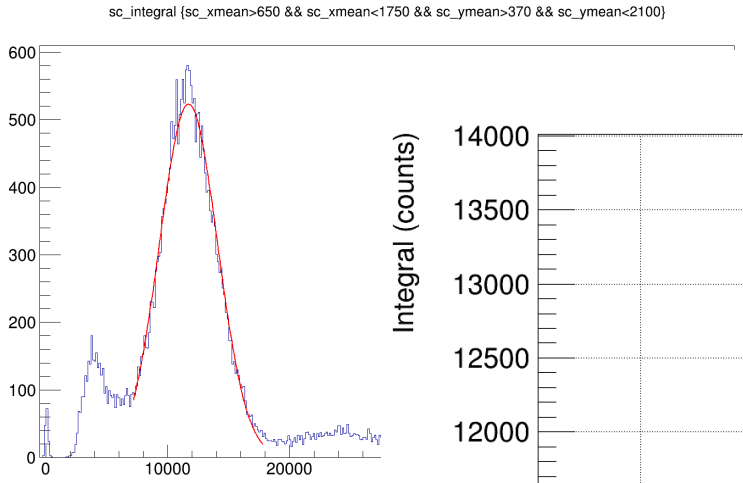
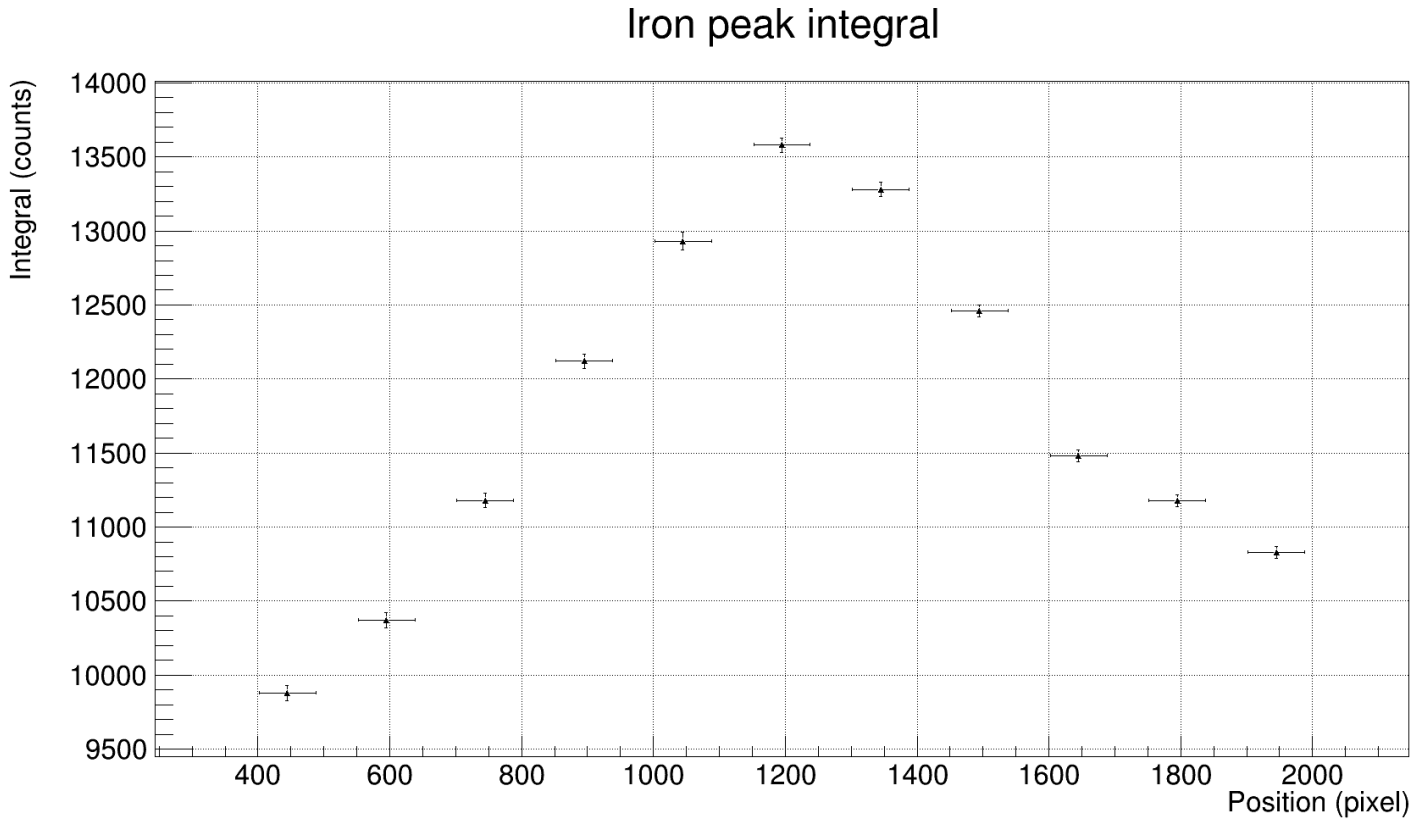
Geometry: Integral

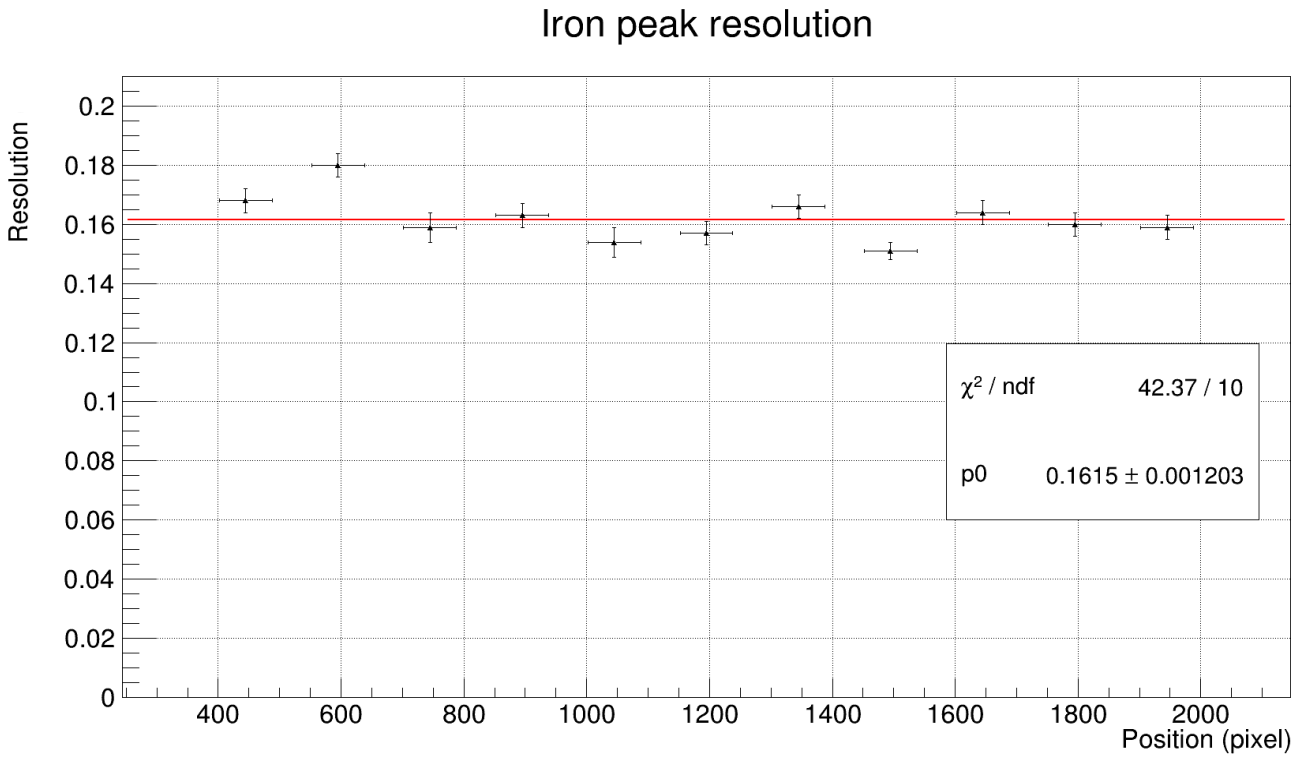


Geometry: Integral

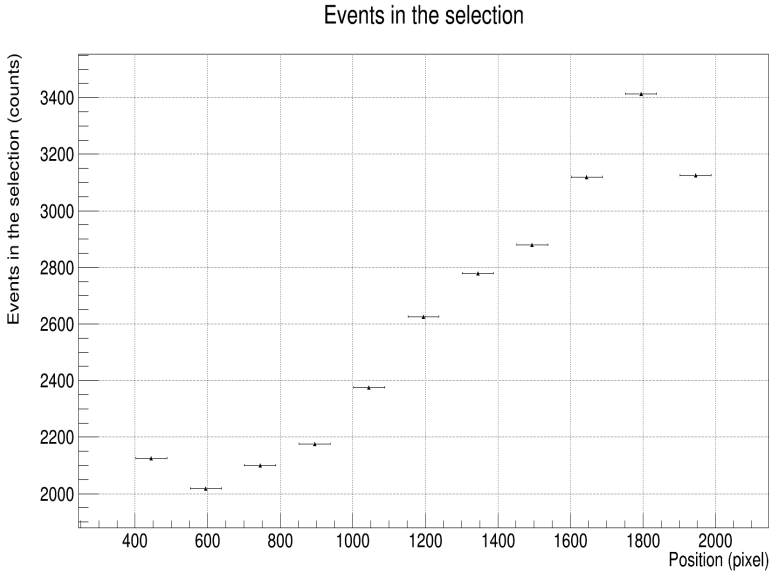




Geometry: Energy resolution and Statistics

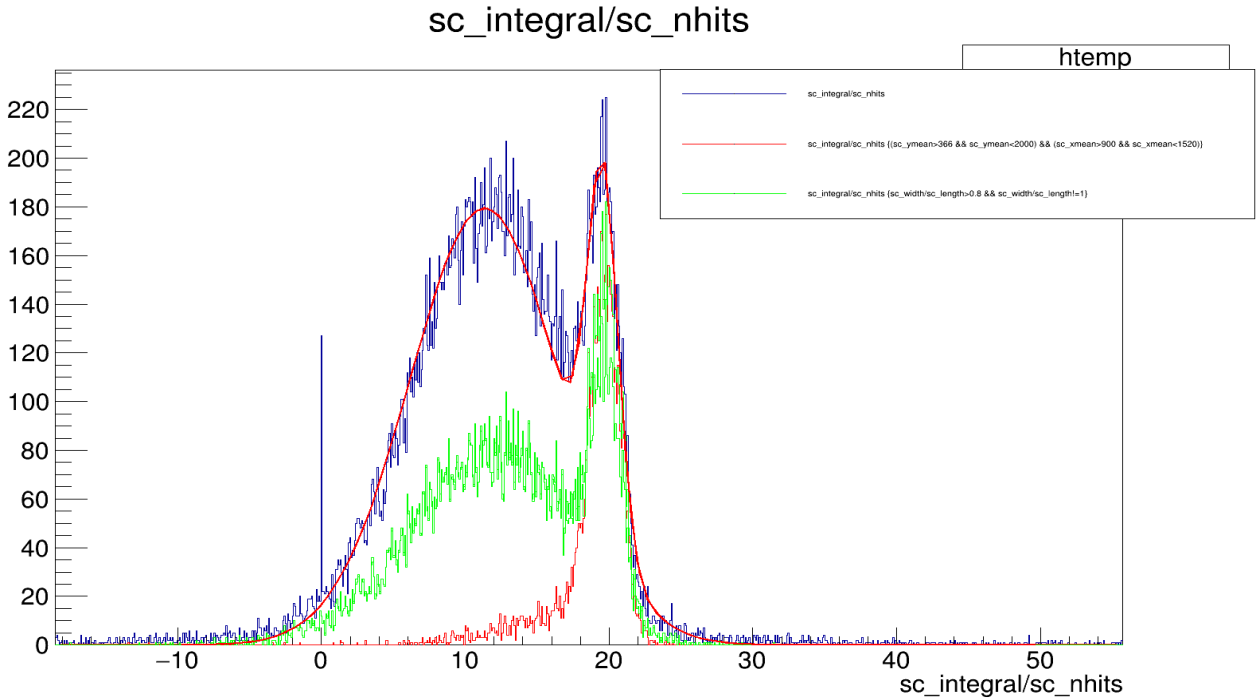


Res=peak/sigma



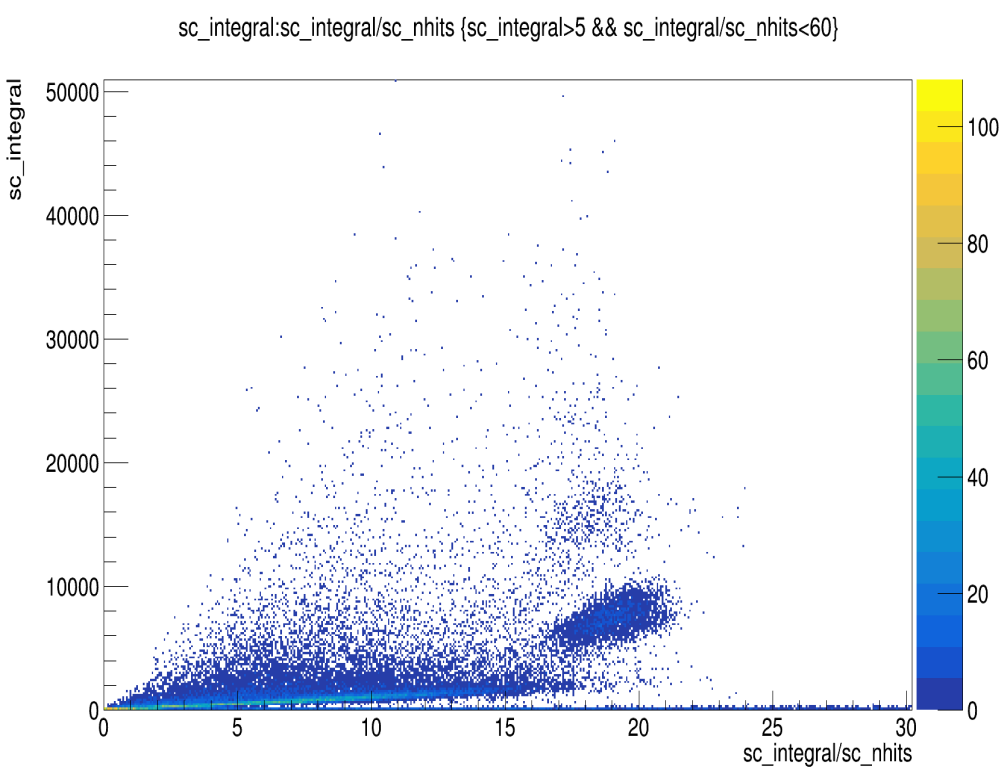
Curve Gain

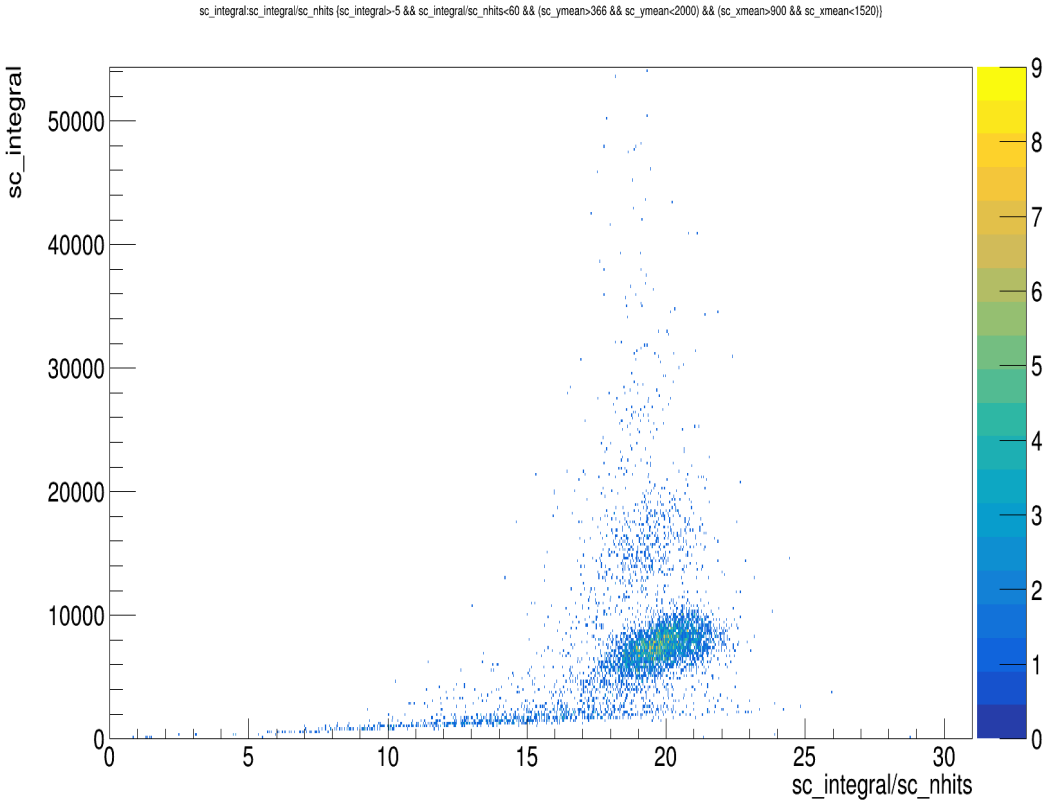
Curve Gain: Cuts



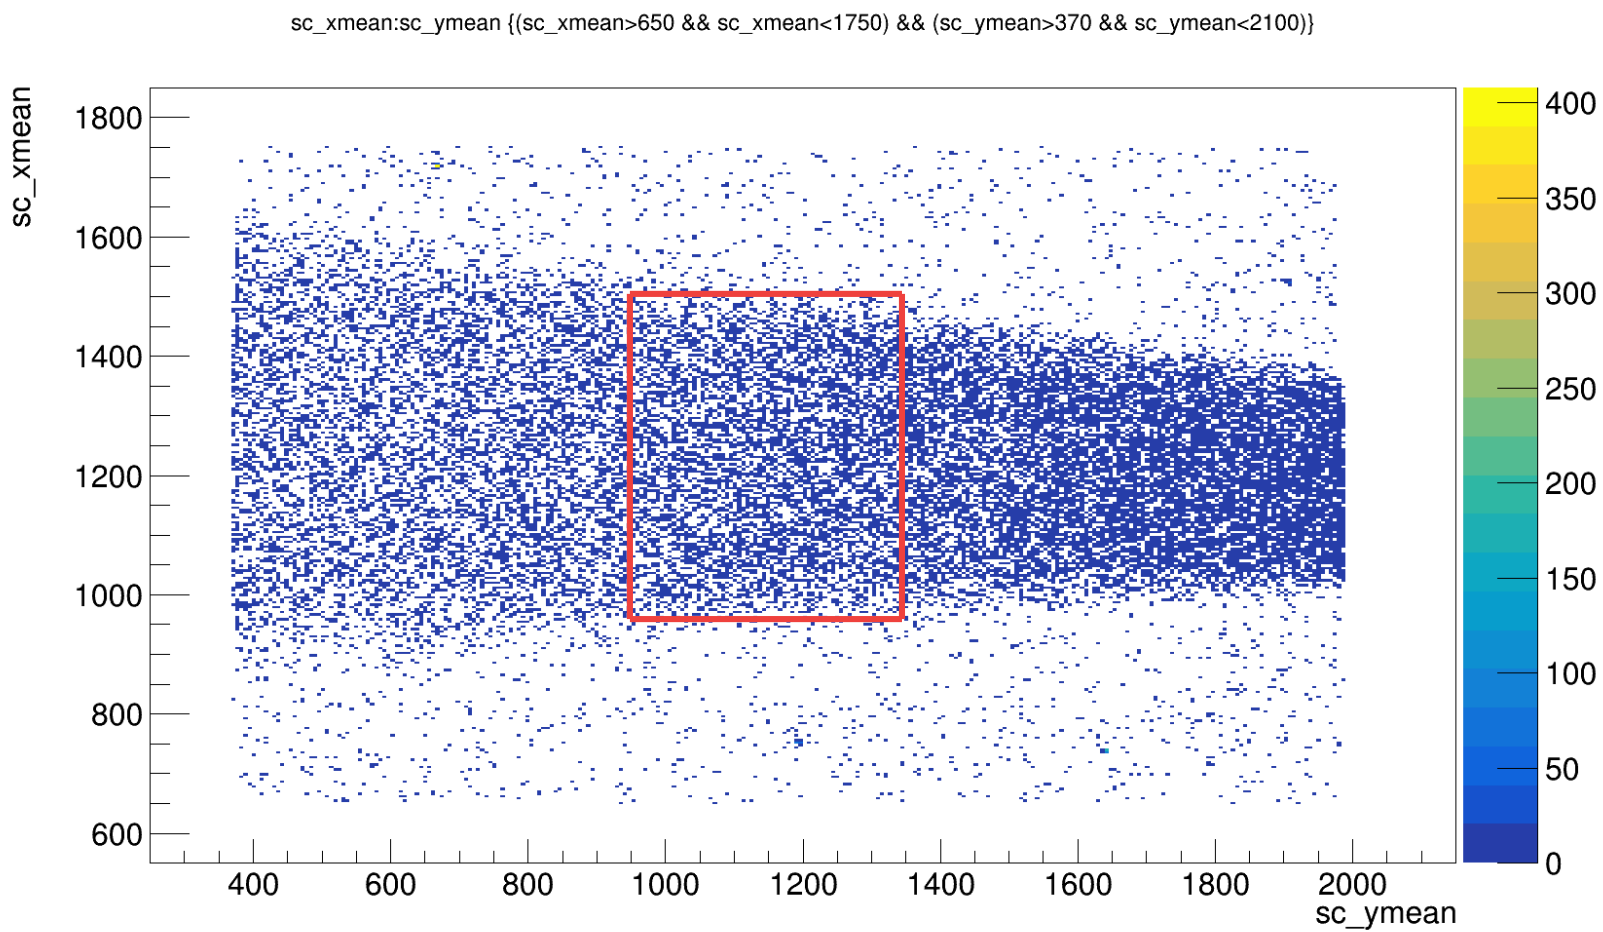
- In the end a simple geometrical cut was used to take the spots in the very centre, also considering the geometrical deformations

Curve Gain: Cuts





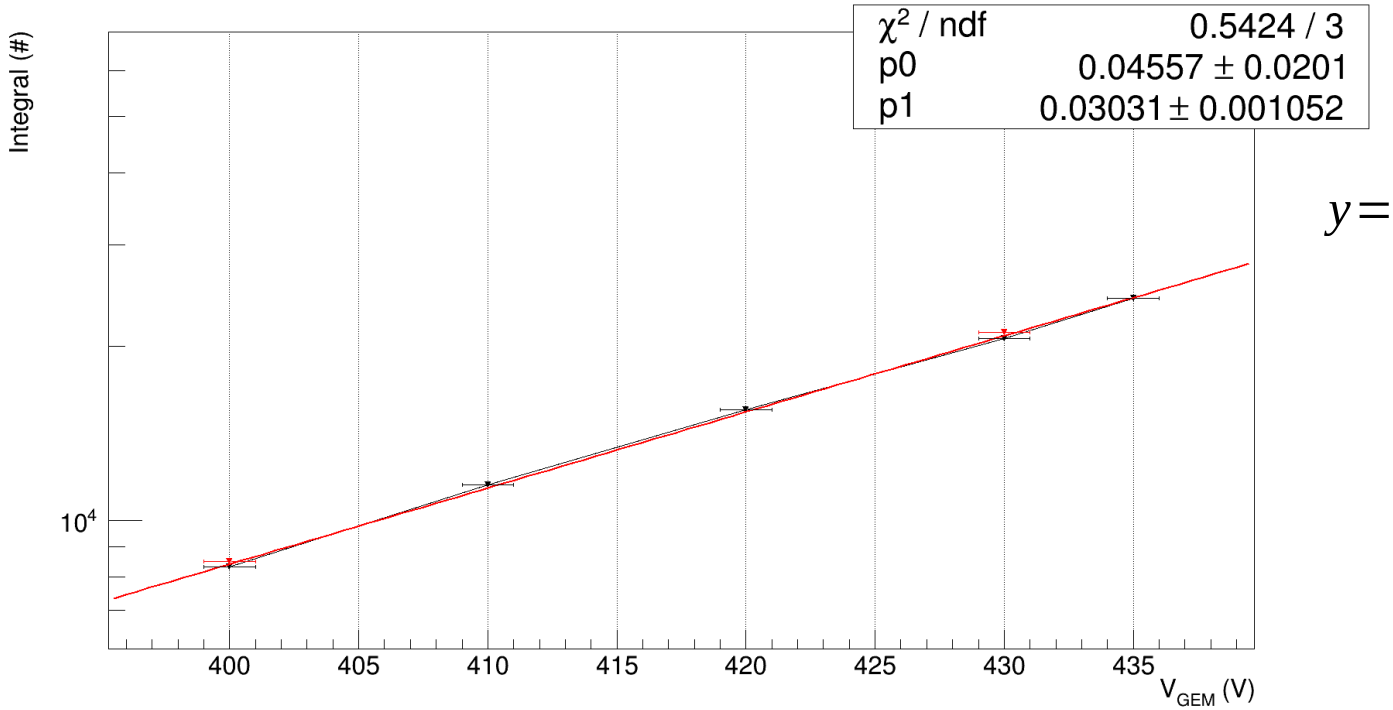
Curve Gain: Cuts



Curve Gain: Gain

- GEM voltages changed together from 400 V to 435 V

- Only a couple of points were analysed with the code after the new Friday's patch (red points)

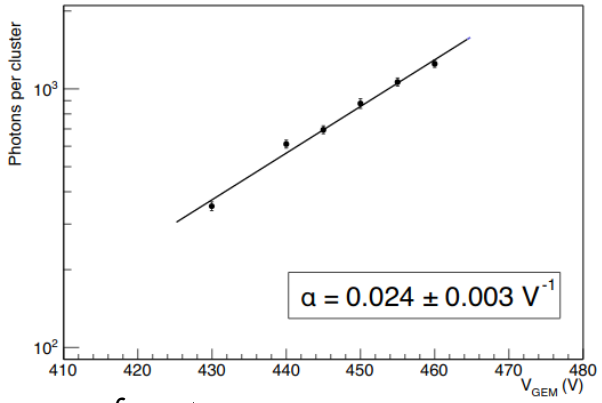


$$y = p0 \cdot e^{p1 \cdot V_{Gem}}$$

Curve Gain: Gain

- GEM voltages changed together from 400 V to 435 V

- Only a couple of points were analysed with the code after the new Friday's patch (red points)

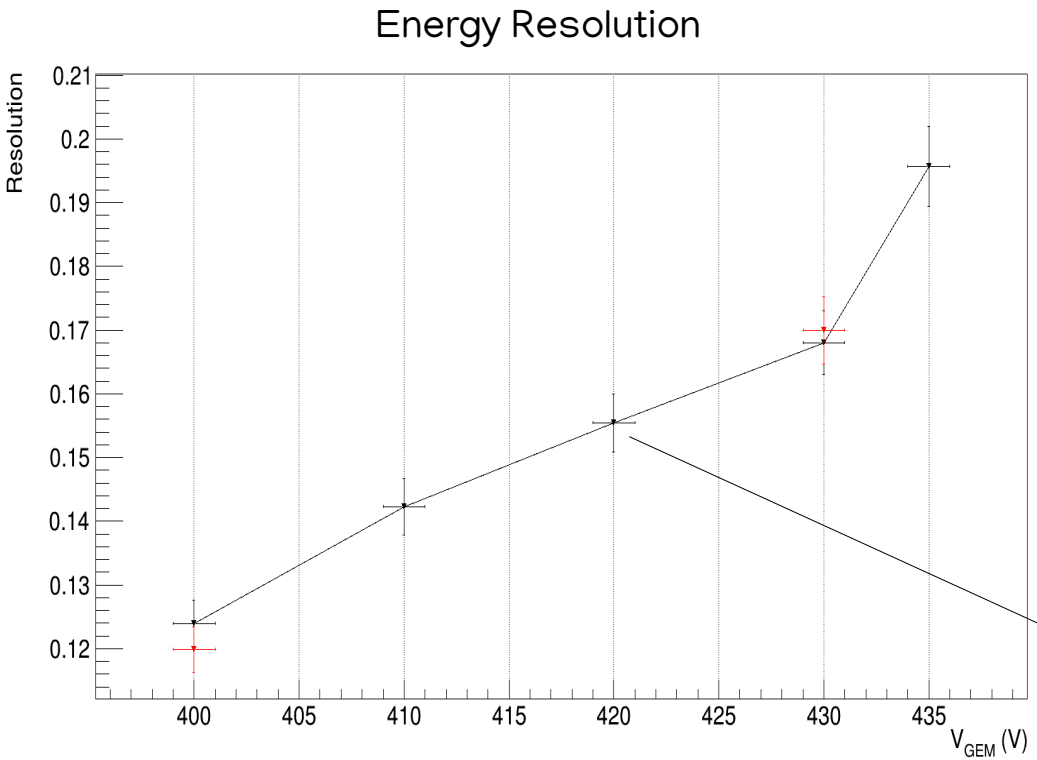


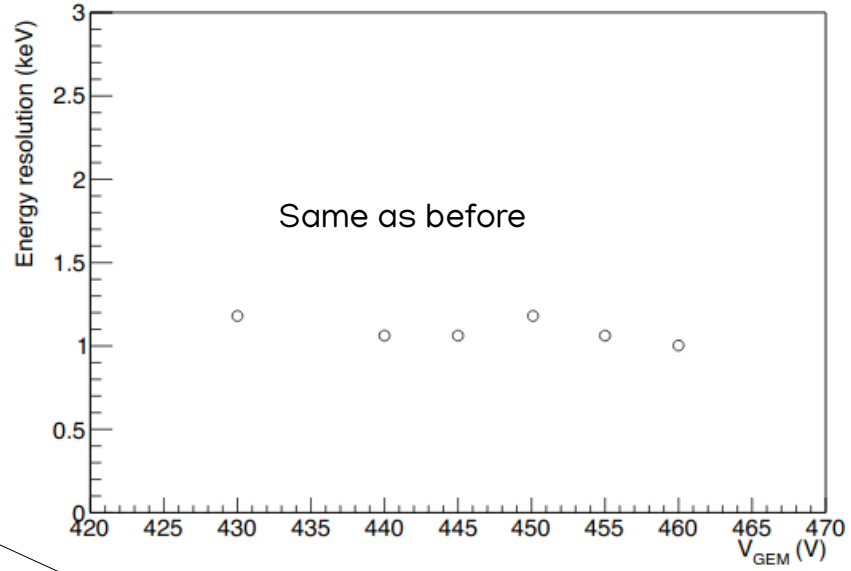
$$y = p0 \cdot e^{p1 \cdot V_{Gem}}$$

From *Performance of Optically Readout GEM-based TPCwith a ^{55}Fe source*

Ever done this scan with new code?

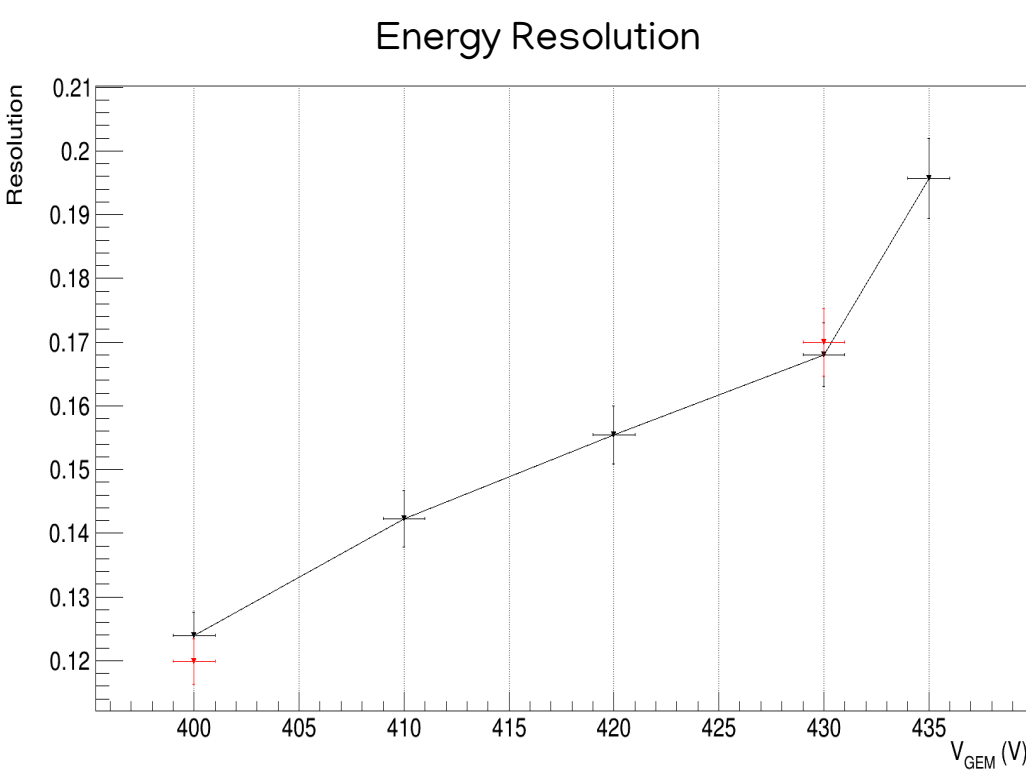
Curve Gain: Energy and spatial resolution

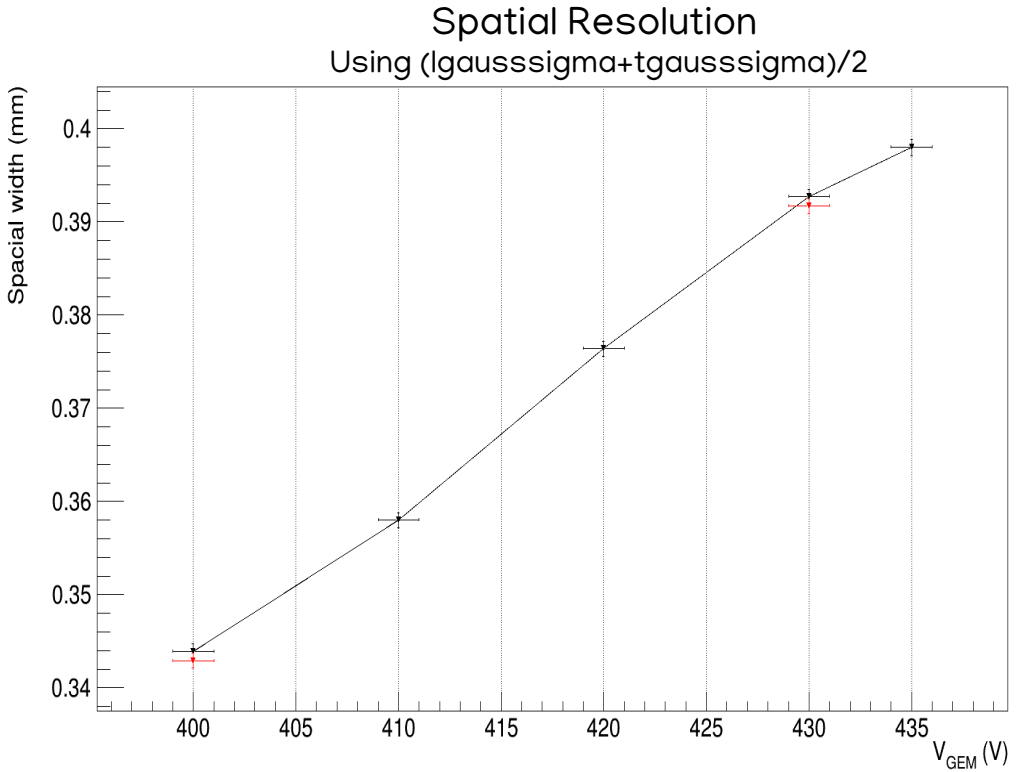




Consistent value with the geometry study with data taken in **different weeks**

Curve Gain: Energy and spatial resolution



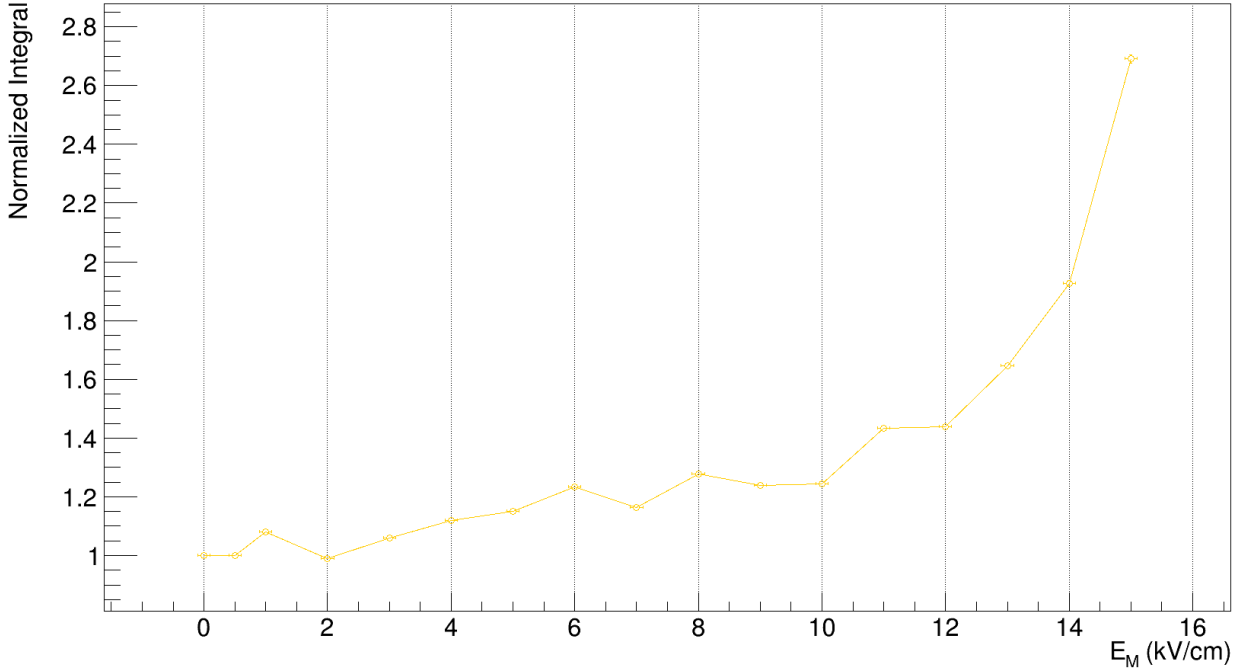


Electroluminescence

EL: Long Exposure

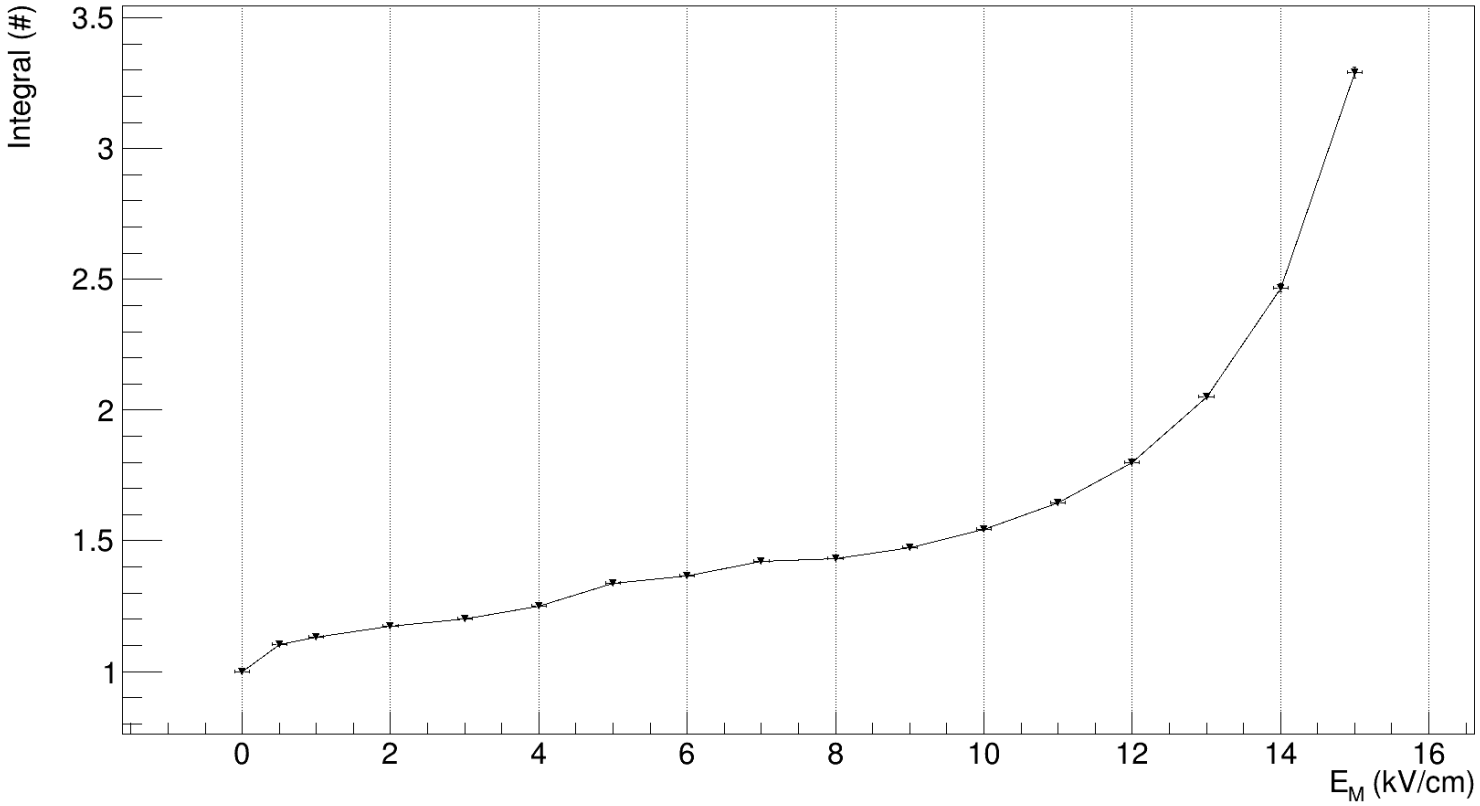
- Central region is taken and, after pedestal subtraction, all the light is integrated.

- Being close with the camera and the source not as intense as the one in Frascati, the outcome is fairly dependent on how many iron spots are present in that part of the picture



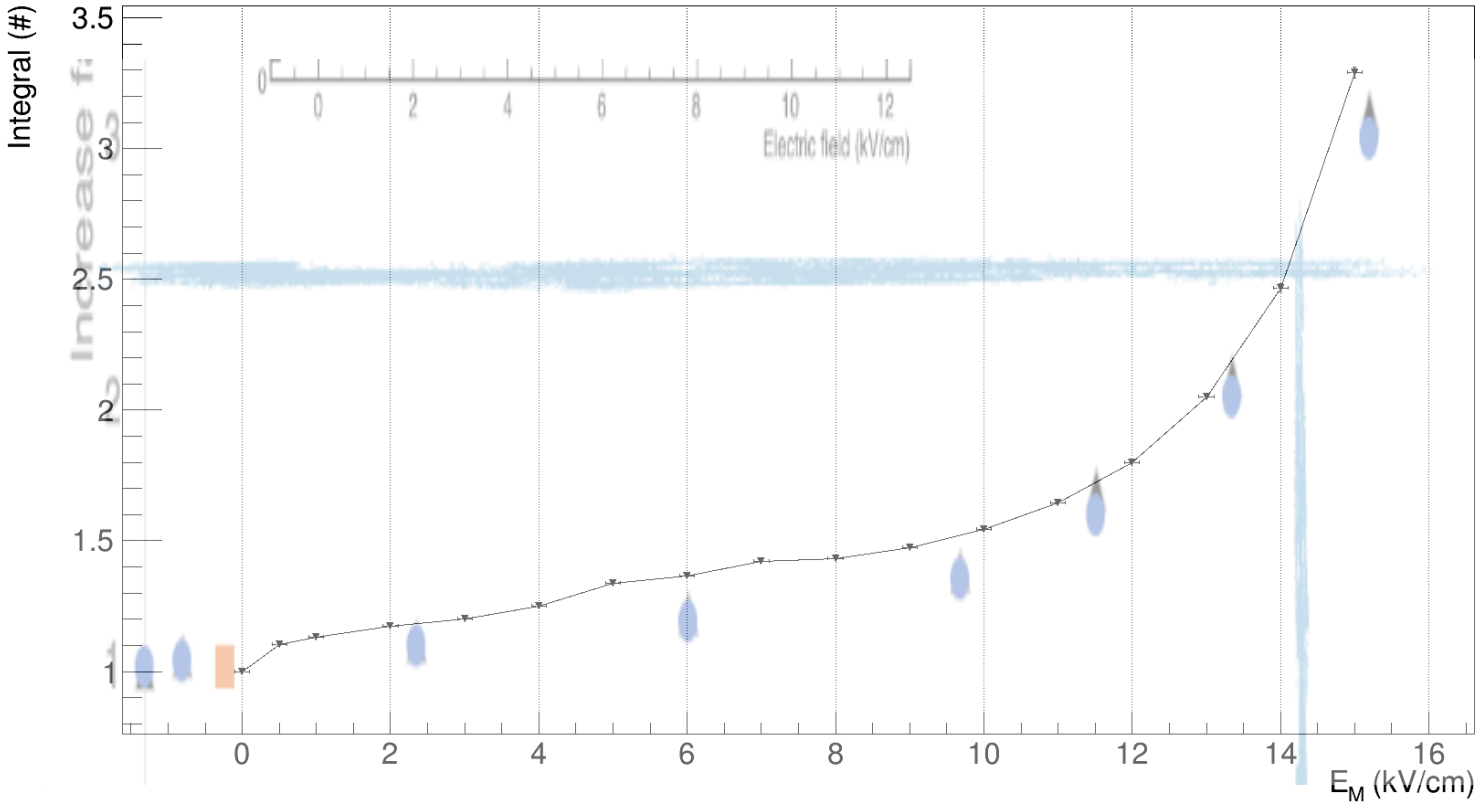
EL: Short Exposure with Iron spots Analysis

- Same cuts applied as in the gain part



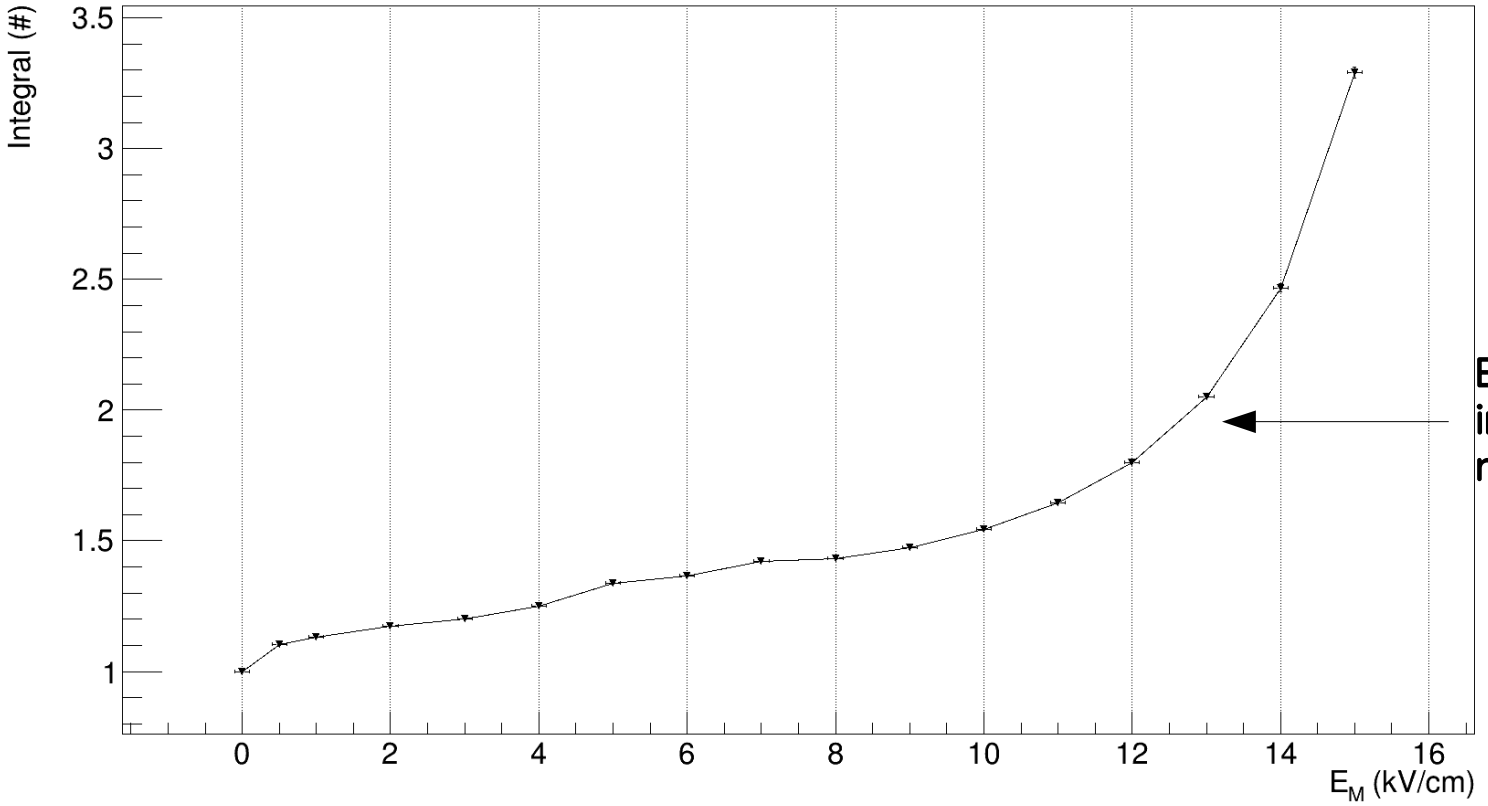
EL: Short Exposure with Iron spots Analysis

- Same cuts applied as in the gain part



EL: Short Exposure with Iron spots Analysis

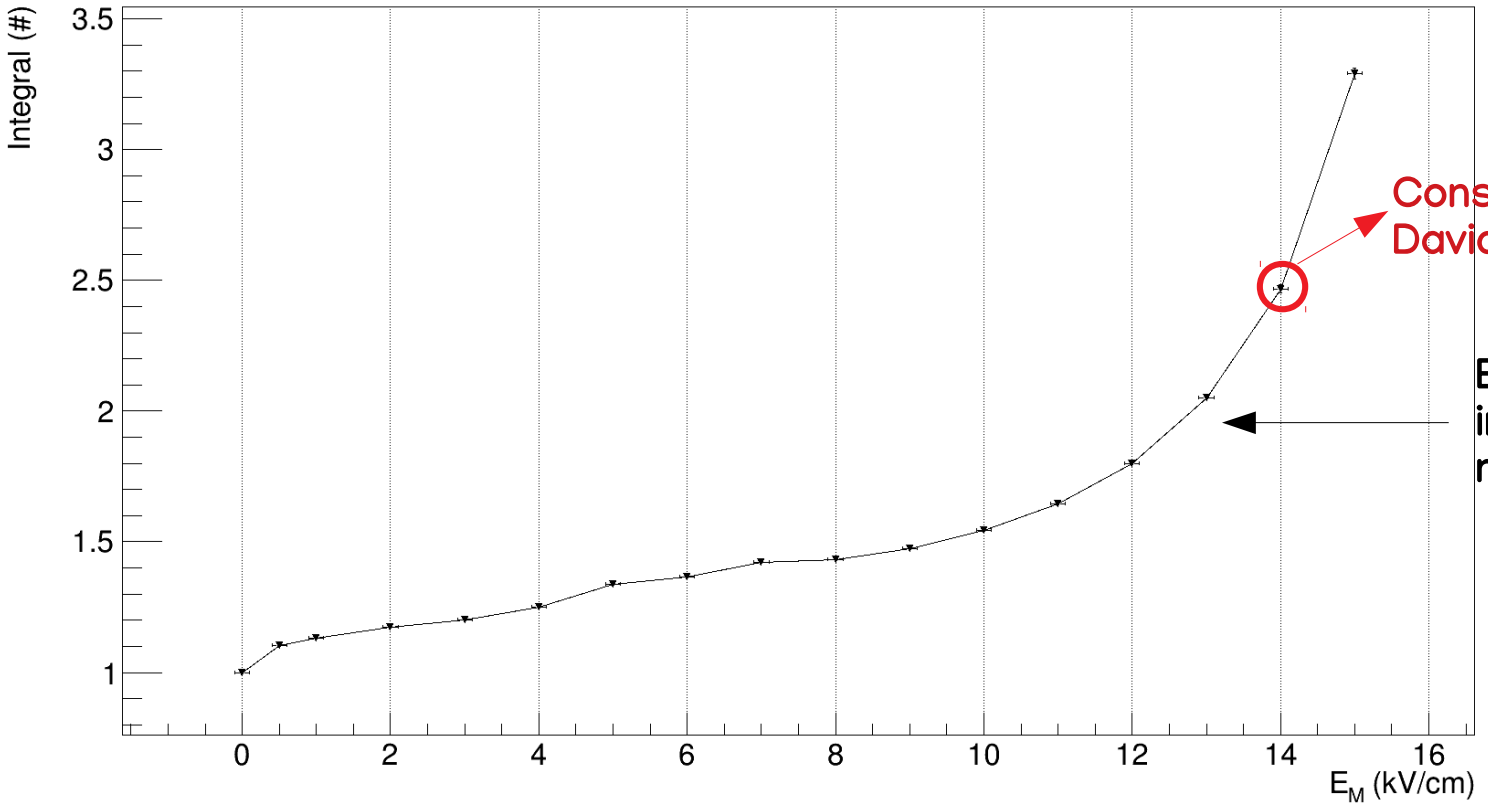
- Same cuts applied as in the gain part



Expected light increase up to more than 3 times

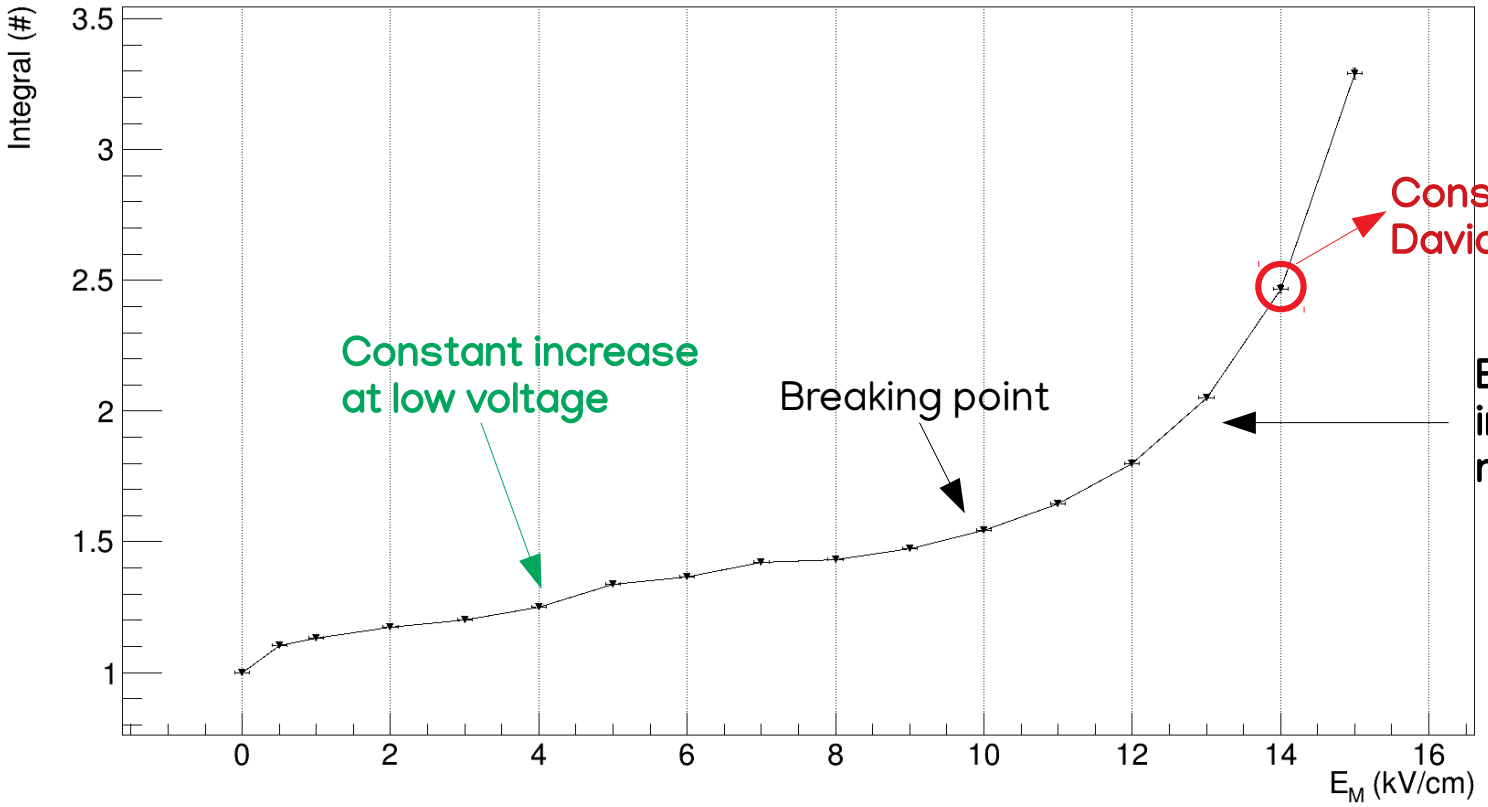
EL: Short Exposure with Iron spots Analysis

- Same cuts applied as in the gain part

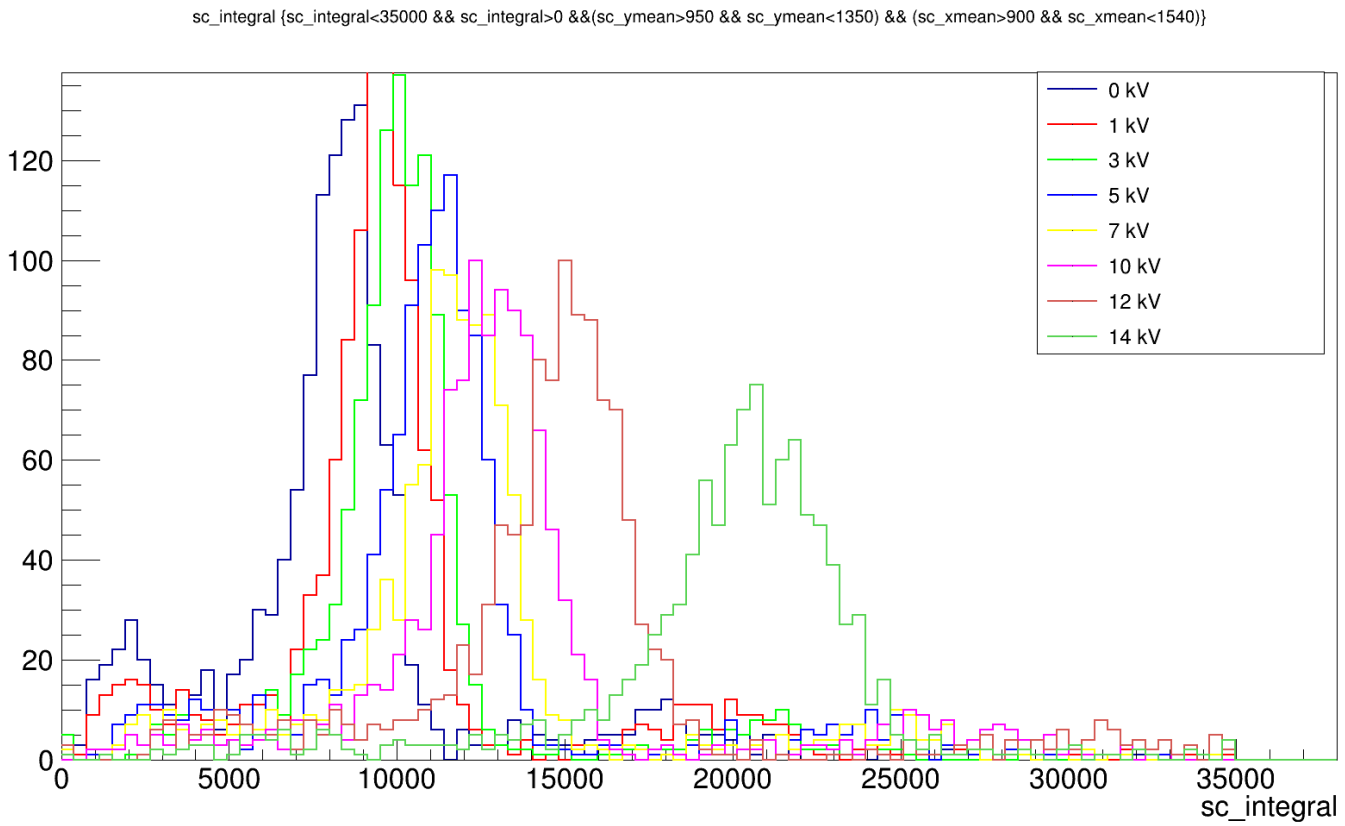


EL: Short Exposure with Iron spots Analysis

- Same cuts applied as in the gain part



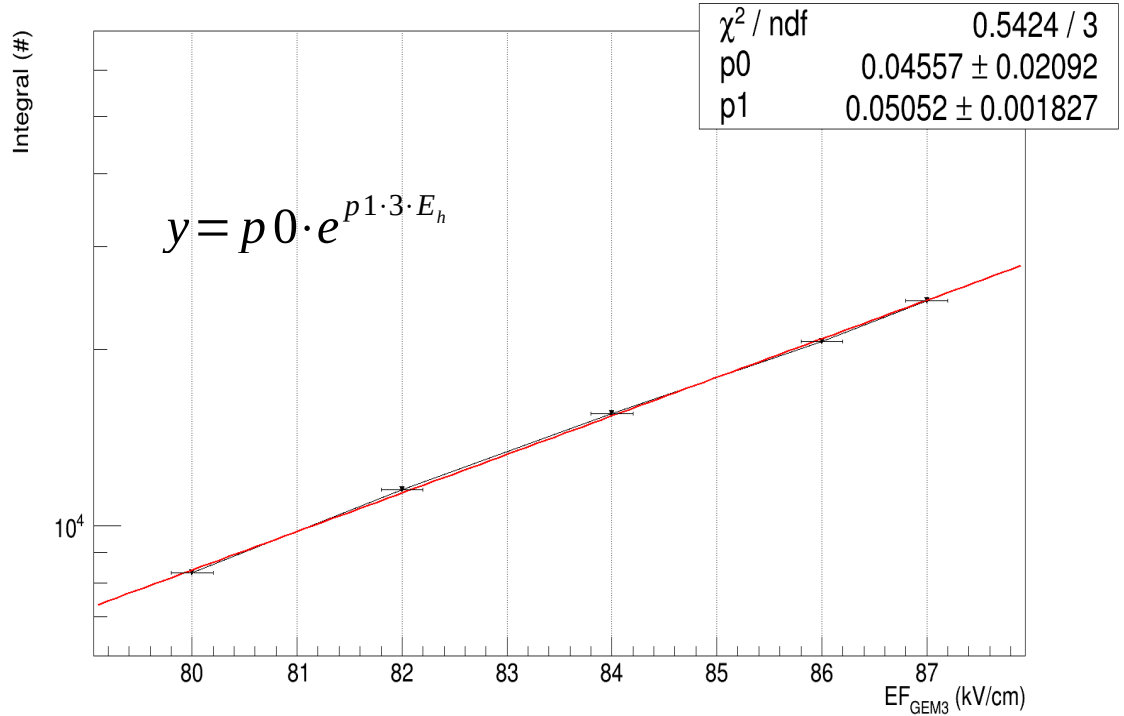
EL: Short Exposure with Iron spots Analysis

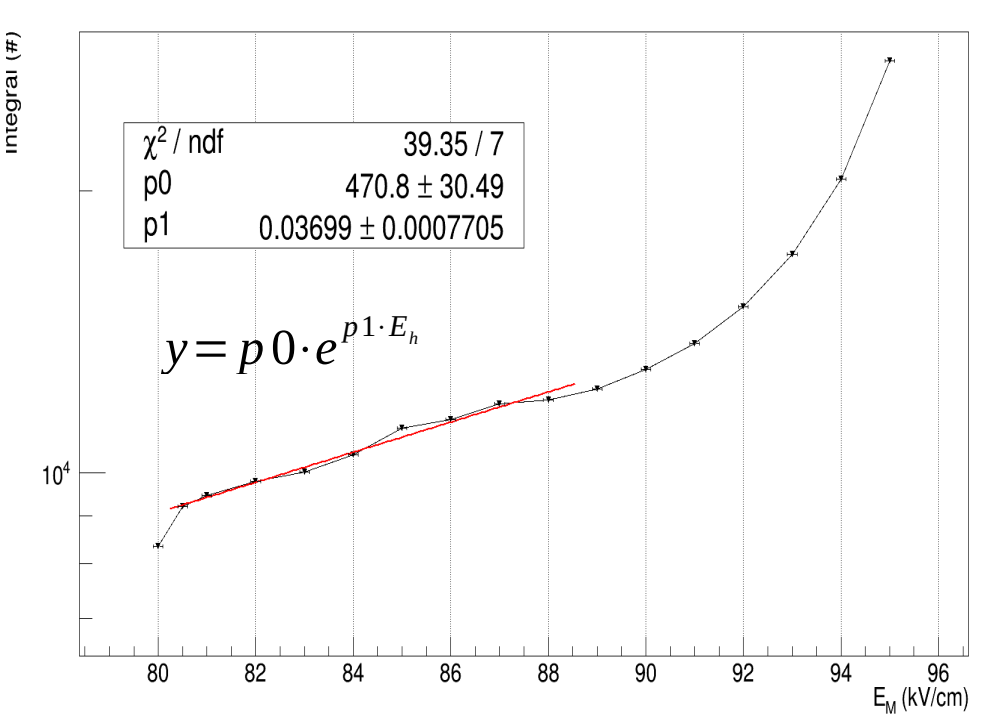


EL: Short Exposure with Iron spots Analysis

- Are we increasing the EF in the hole by adding a field between GEM and Mesh?

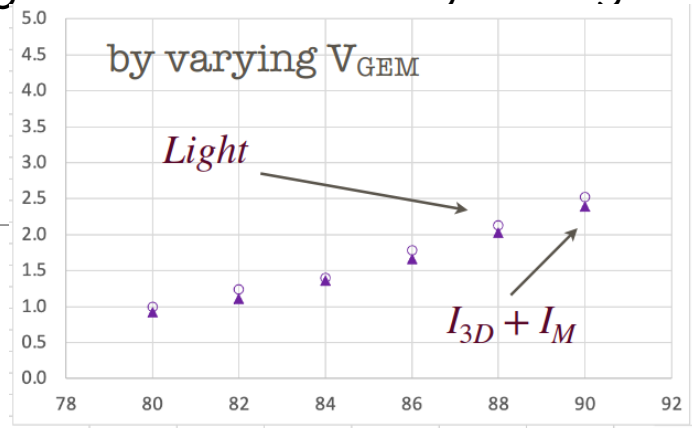
$$E_h = \frac{V_{GEM}}{50\mu m} + E_M$$

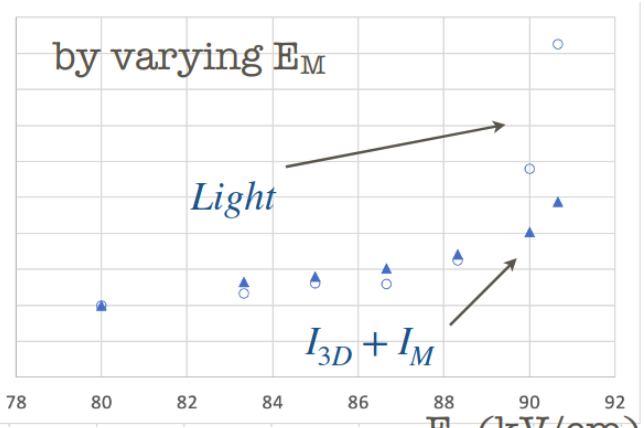




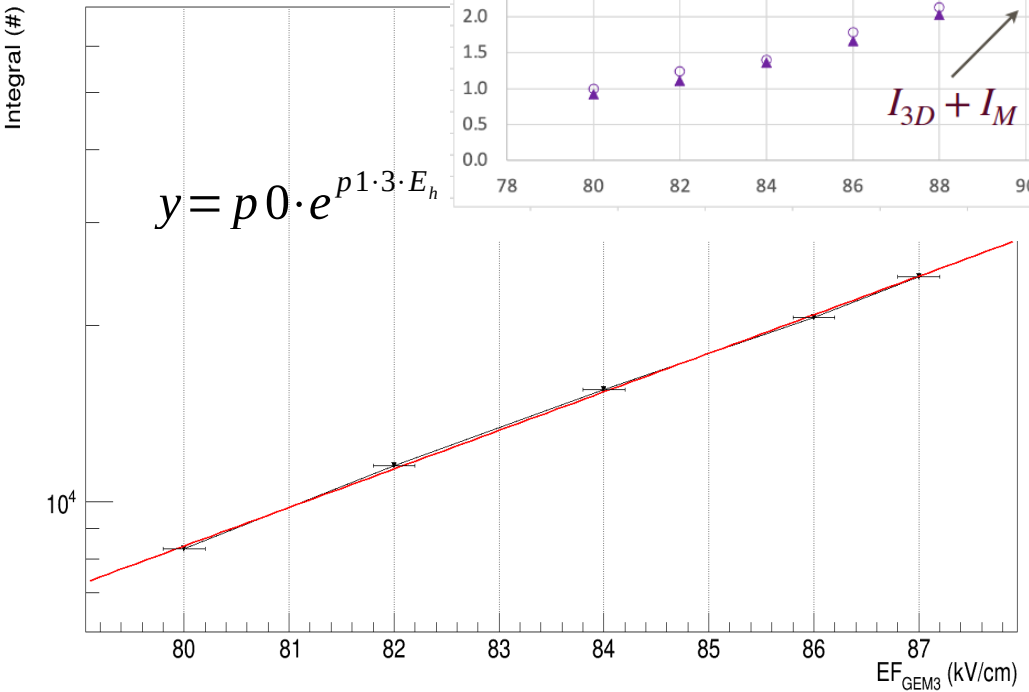
EL: Short Exposure with Iron spots Analysis

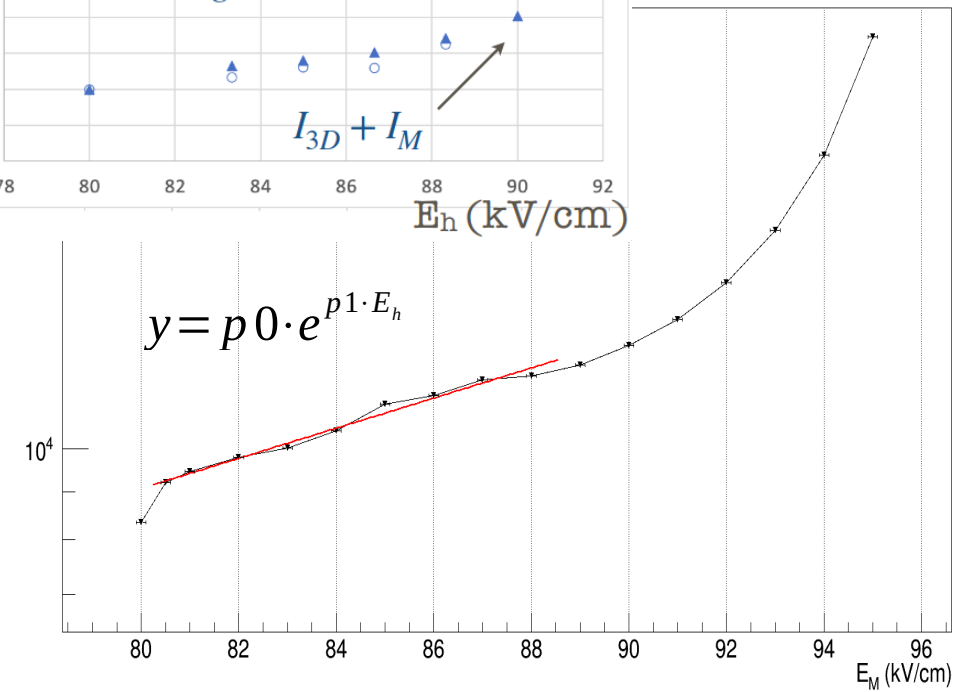
- Are we increasing the EF in the hole by adding a field between GEM and Mesh?





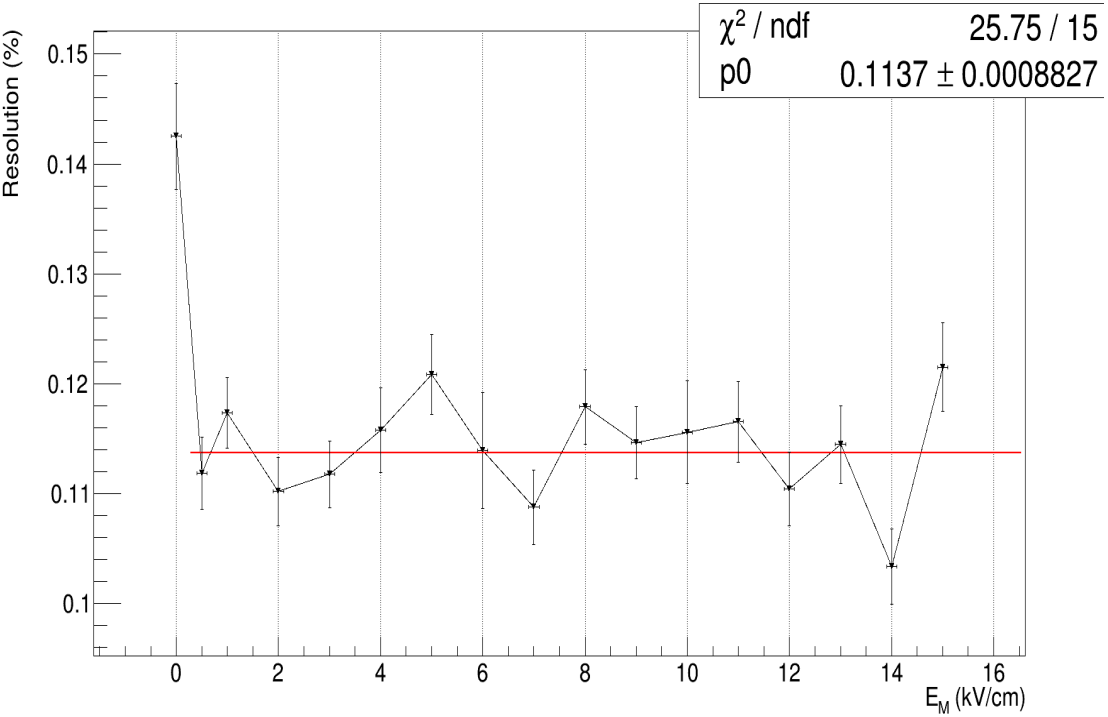
$+ E_M$

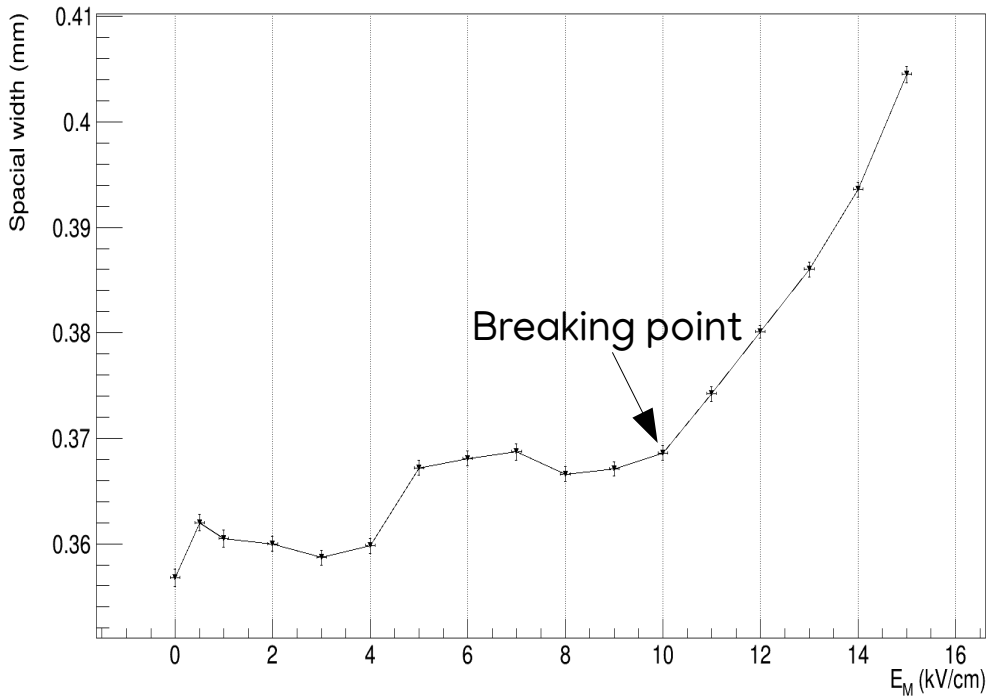




EL: Short Exposure Energy and Spatial Resolution

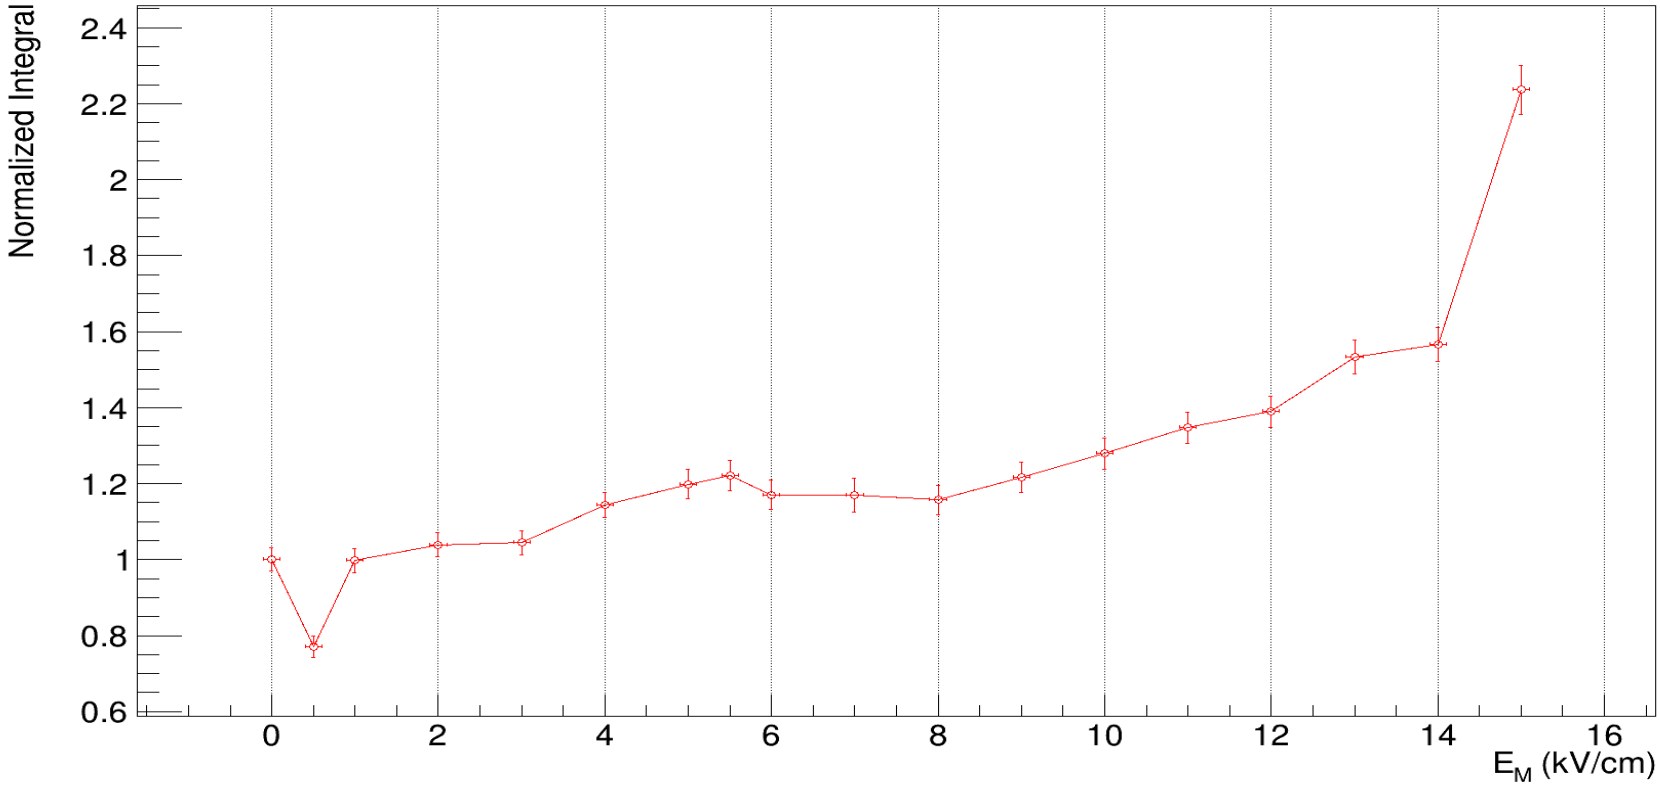
- Are we increasing the EF in the hole by adding a field between GEM and Mesh?





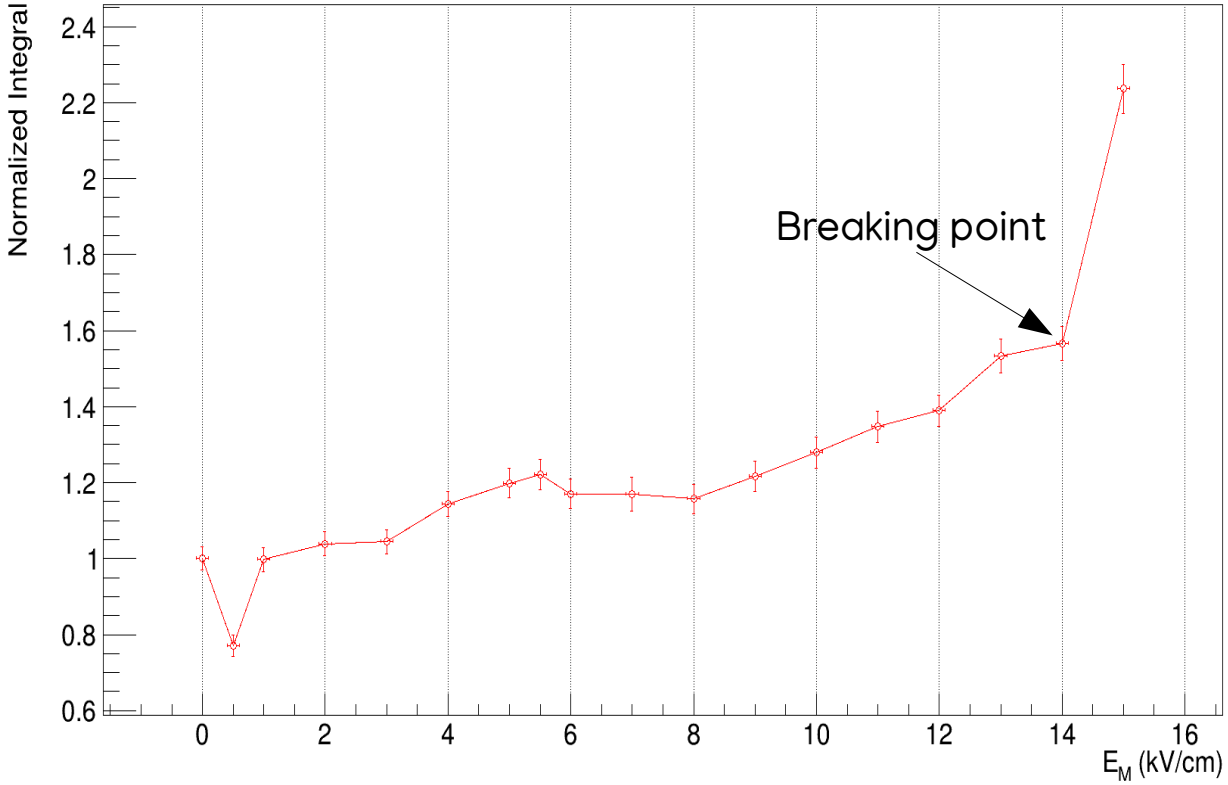
EL: Short Exposure PMT

- Waveforms are integrated from the oscilloscope and the iron peak is found also here

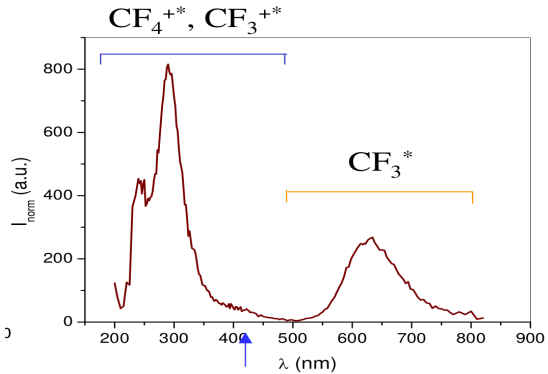


EL: Short Exposure PMT

- Waveforms are integrated from the oscilloscope and the iron peak is found also here



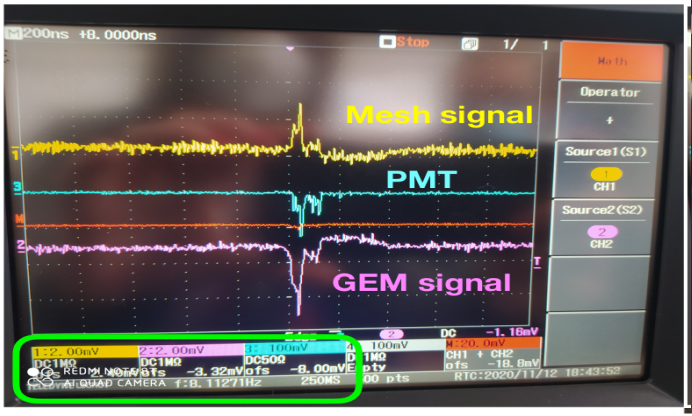
PMT more sensitive to UV



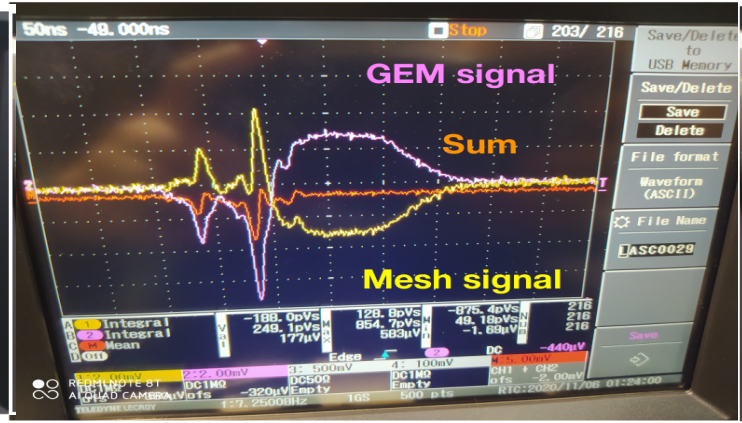
Electronic excitation (dissociation into neutral fragments)†	12.5 (10)	12.5 (10)
Dissociative ionization†	15.9	15.9

EL: Charge Analysis

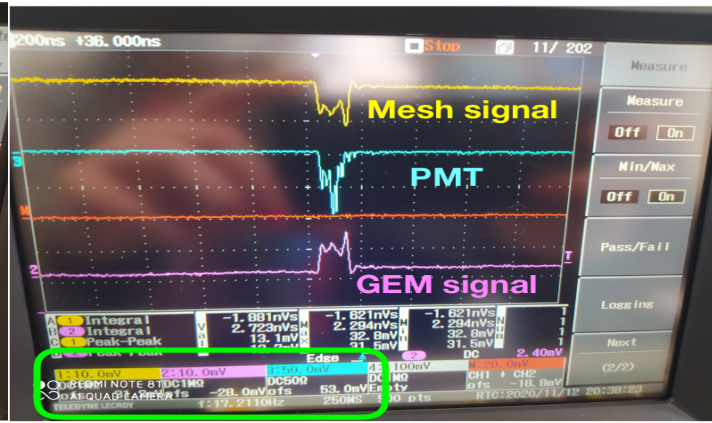
0 kV



0,3 kV



12 kV

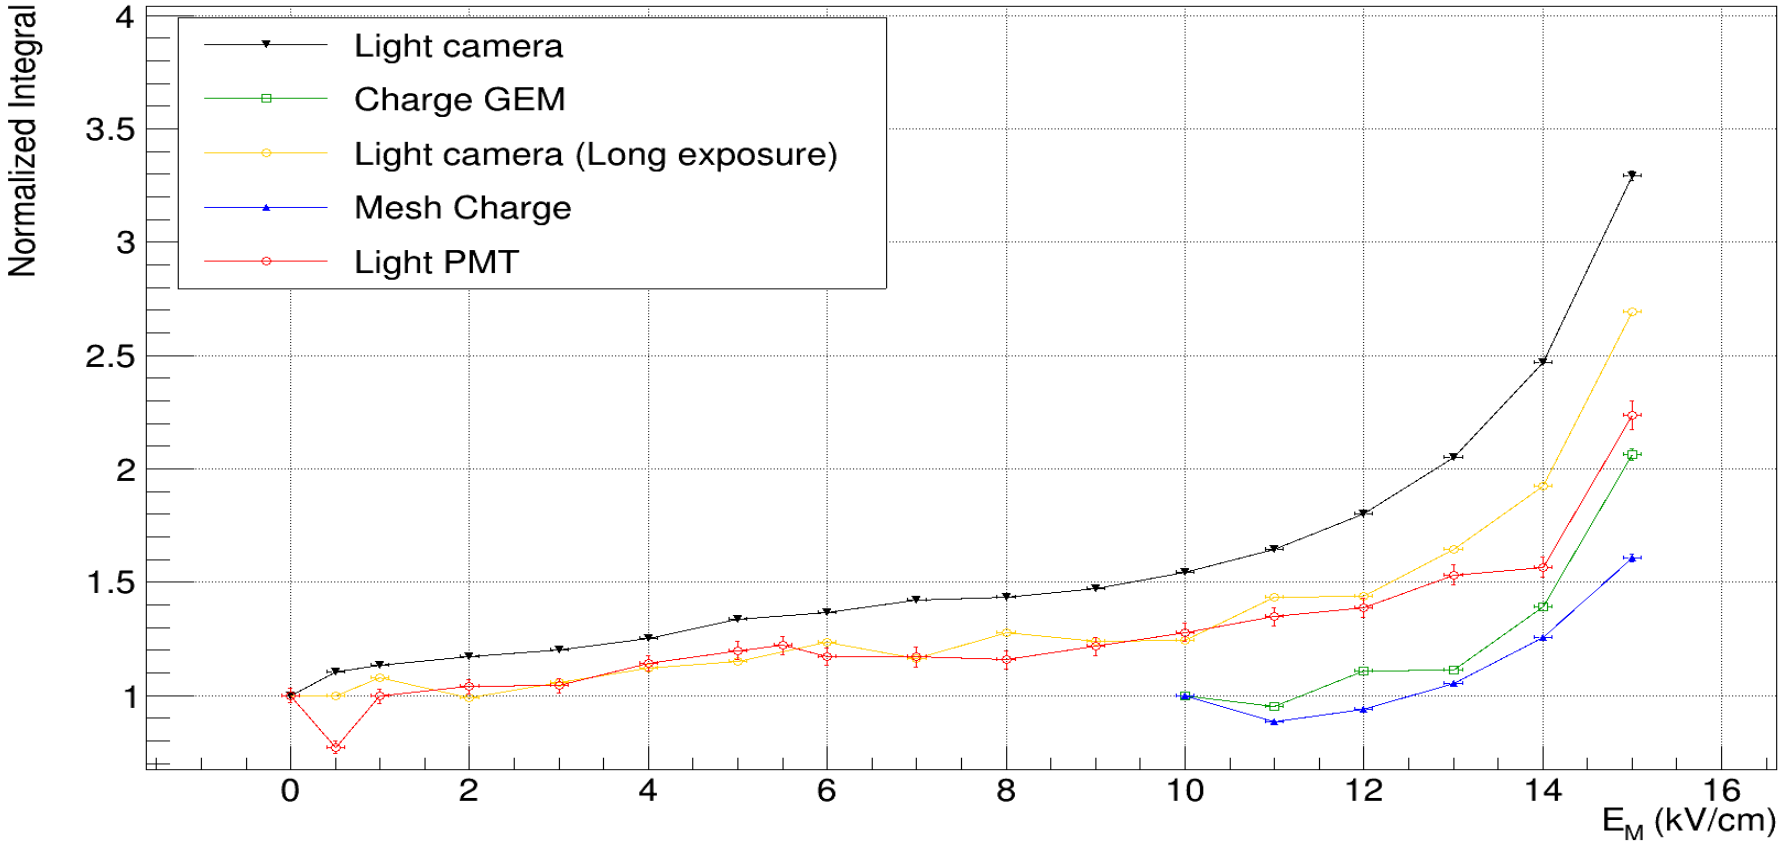


EL: Charge Analysis

- We have the integral of the waveforms calculated by the oscilloscope
- We can select the integral related to the iron spots
- After discussing with Luciano we think that:
  Due to the RC circuit we do not read the whole charge but probably only the fast component

Electron time for crossing the GEM–mesh gap	~ 40 ns
Ion time for crossing the GEM–mesh gap	~ ms
RC constant	~ 200 us

EL: All Together



Conclusion

- Data was taken with MANGO with iron 55 source at LNGS
- We observe a geometrical dependency of the light output
- Some analysis on the energy and spatial resolution were performed as a function of GEM voltage and induction field
- With GEM at 435 V we do not see clear signs of saturation
- The electroluminescence study is consistent with data taken in Frascati and points at a clear increase in light output with reduced increase in charge without affecting the energy resolution
