

A visualization of a particle collision at the LHC. A bright white point of collision at the top center emits a starburst of light rays. From this point, a central track of orange and yellow particle clusters extends downwards. To the right, two large, semi-transparent spheres are shown: a blue one and a red one, both containing internal particle-like structures. Several smaller, greyish spheres are scattered in the background.

Study of the strong interaction among hadrons with correlations at the LHC

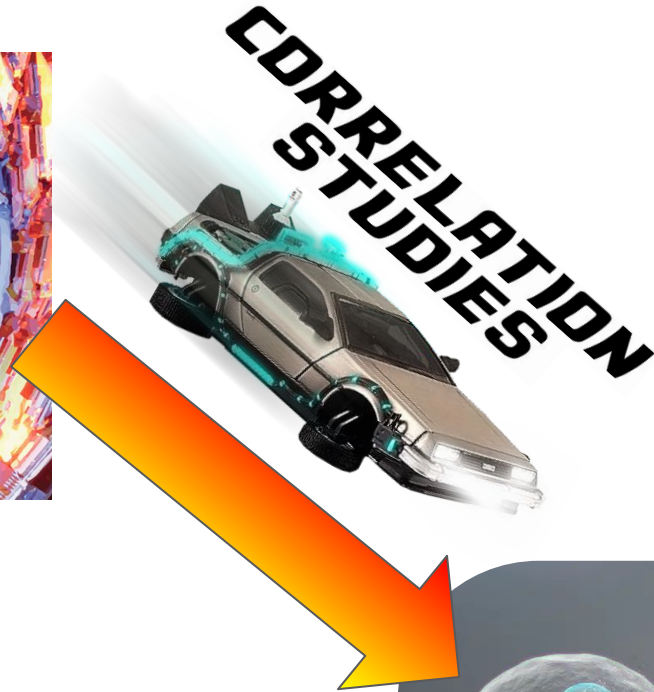

Otón Vázquez Doce (LNF -INFN)

**Fundamental Physics at the Strangeness Frontier, Frascati (online)

Central barrel tracking and PID:

Reconstruction of hyperons:

- $\Lambda \rightarrow p\pi$
- $\Xi \rightarrow \Lambda\pi$
- $\Omega \rightarrow \Lambda K$

Allow to study up to $S = -3$, p - Ω

Hadron physics

Correlations

- **Precise data in the low momentum range**, in most cases not accessible with other approaches.
- **Test/constraint** ChET, meson exchange models, Lattice QCD, etc
- Consequences for, e.g., appearance of strange particles in neutron stars, existence of strange di-baryons

Outline

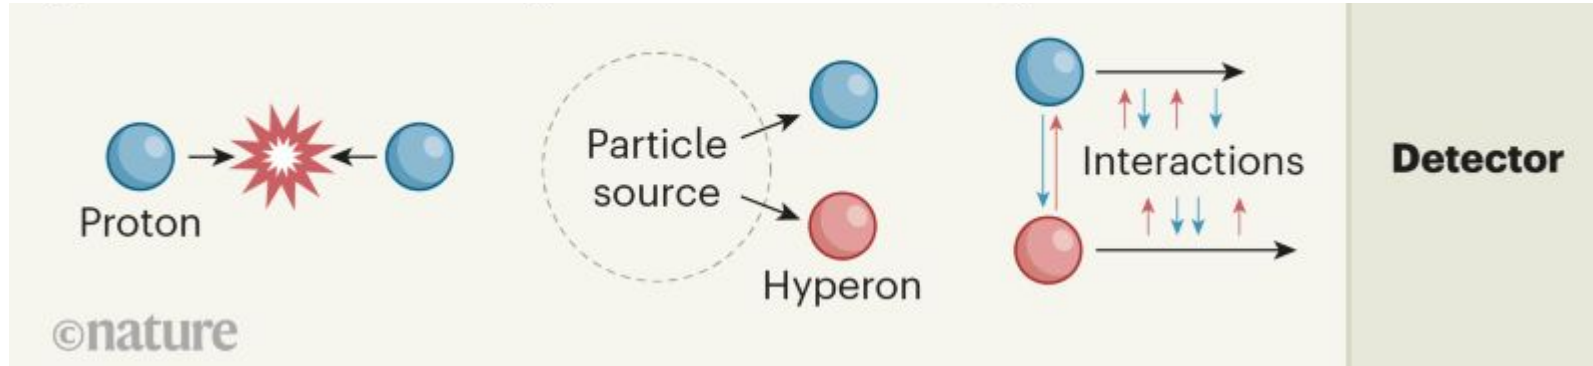

Correlation method

- Femtoscopy-like studies
- Detailed knowledge of the source of particles

Experimental results:

- K^-p
- $p-\Omega^-$

Two-particle correlations as a tool for studying h-h interactions

<https://www.nature.com/articles/d41586-020-03393-z>

Femtoscopy (HBT) analyses in **Heavy Ions Collisions**:

- Study pairs of particles with “known” interaction
- Centered in **study the dimensions of the source** (2-5 fm)

Two-particle correlations as a tool for studying h-h interactions

Based on the correlation function $C(k^*) = \frac{P(\vec{p}_a, \vec{p}_b)}{P(\vec{p}_a)P(\vec{p}_b)}$, with $k^* = |\vec{p}_2^* - \vec{p}_1^*|/2$ and $p_1^* = -p_2^*$

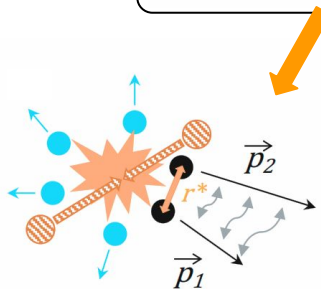

Theoretically formulated: $C(k^*) = \int S(r^*) |\Psi(k^*, \vec{r}^*)|^2 d^3r^*$

Two-particle correlations as a tool for studying h-h interactions

Based on the correlation function $C(k^*) = \frac{P(\vec{p}_a, \vec{p}_b)}{P(\vec{p}_a)P(\vec{p}_b)}$, with $k^* = |\vec{p}_2^* - \vec{p}_1^*|/2$ and $p_1^* = -p_2^*$

Theoretically formulated:

$$C(k^*) = \int S(r^*) |\Psi(k^*, \vec{r}^*)|^2 d^3r^*$$

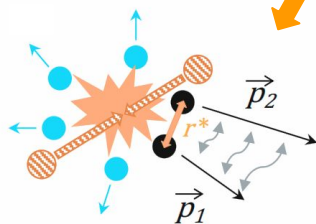

Emission source $S(r^*)$

Two-particle correlations as a tool for studying h-h interactions

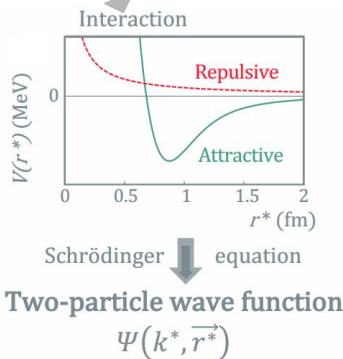

Based on the correlation function $C(k^*) = \frac{P(\vec{p}_a, \vec{p}_b)}{P(\vec{p}_a)P(\vec{p}_b)}$, with $k^* = |\vec{p}_2^* - \vec{p}_1^*|/2$ and $p_1^* = -p_2^*$

Theoretically formulated:

$$C(k^*) = \int S(r^*) |\Psi(k^*, \vec{r}^*)|^2 d^3r^*$$

Emission source $S(r^*)$

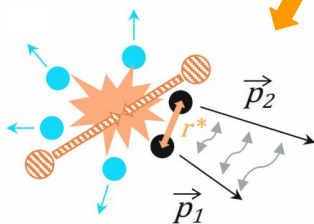

Two-particle correlations as a tool for studying h-h interactions

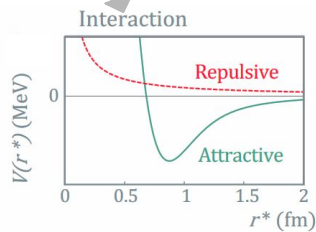

Based on the correlation function $C(k^*) = \frac{P(\vec{p}_a, \vec{p}_b)}{P(\vec{p}_a)P(\vec{p}_b)}$, with $k^* = |\vec{p}_2^* - \vec{p}_1^*|/2$ and $p_1^* = -p_2^*$

Theoretically formulated:

$$C(k^*) = \int S(r^*) |\Psi(k^*, \vec{r}^*)|^2 d^3r^*$$

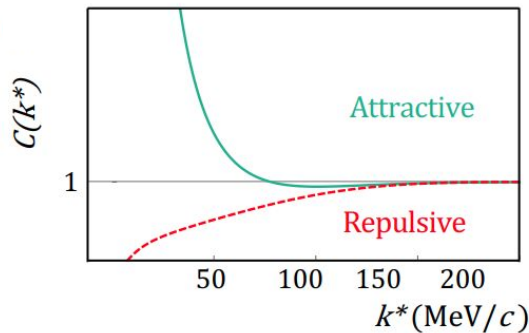

Emission source $S(r^*)$

Schrödinger equation

Two-particle wave function
 $\Psi(k^*, \vec{r}^*)$

K-p correlations: The KN interaction

K-p correlations: The KN interaction

- K^+p interaction repulsive and well established
- Kp features a strong attraction
 - appearance of the $\Lambda(1405)$ below threshold
 - $\Lambda(1405)$: antiKN- $\Sigma\pi$ molecular state
- Kp scattering data and kaonic hydrogen data used to constrain the amplitude below threshold

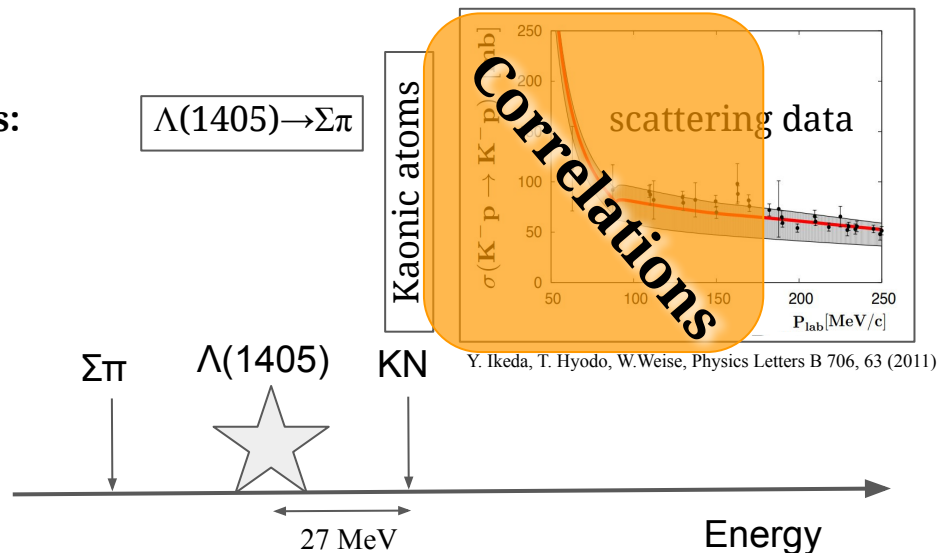

Experiments:

channel**

Coupled channel effect

$$M(K^-p) + 5 \text{ MeV} = M(n\bar{K}^0)$$

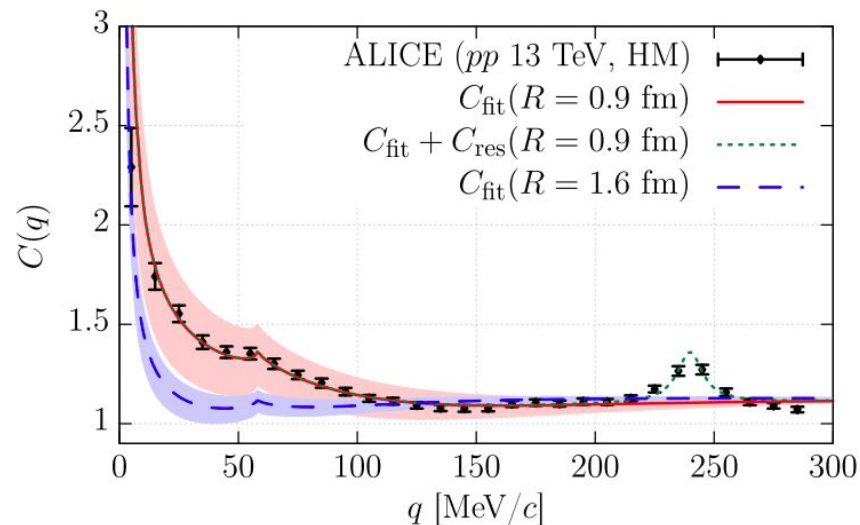

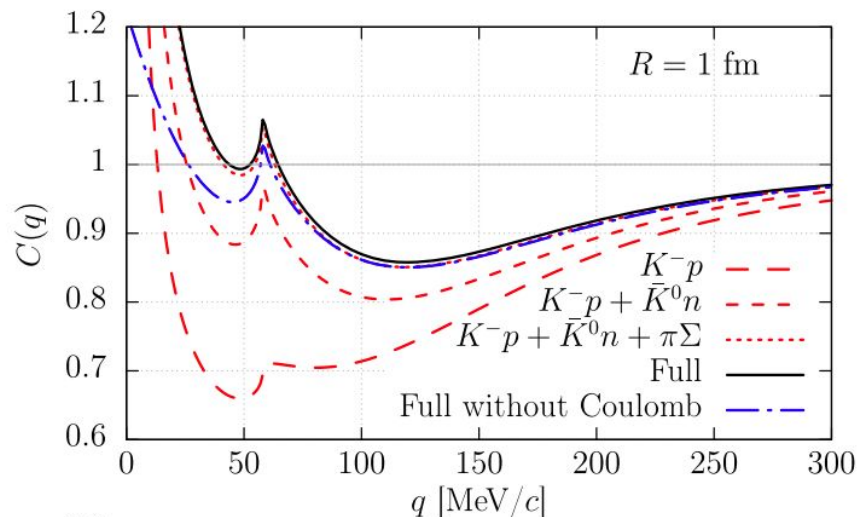

n	p
\bar{K}^0	K^-

K-p correlations: model constraint

Update of the Kyoto model: **coupled-channel effects**

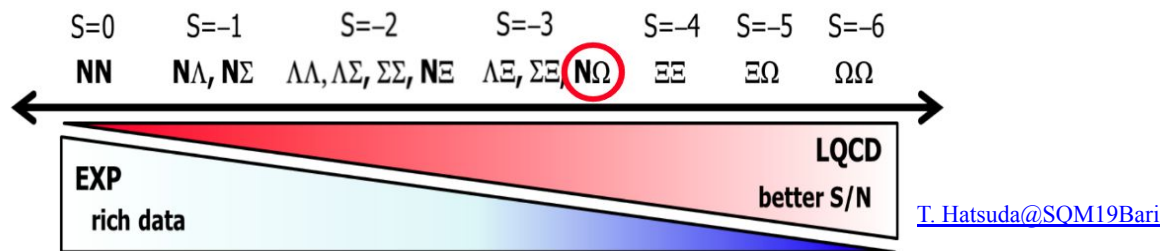

- Dependence on the system size

[Y. Kamiya et al., Phys. Rev. Lett. 124, 132501 \(2020\)](#)

Lattice QCD with $S=-3$

Lattice QCD with $S=-3$

- **First principle calculations** in the strangeness sector:
 - Recent developments by lattice QCD at the physical point
- baryon-baryon sector:
 - models constrained by **data with limited precision** (in contrast with N-N interactions)
- Difficulties to produce beams of hyperons

⇒ Correlation studies can bring balance experiment-theory

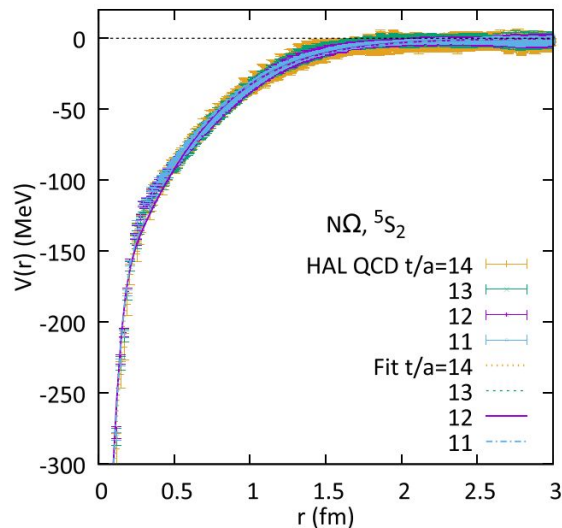

ALICE make use of high-multiplicity pp collisions with an **enhanced production of strangeness**

[ALICE Coll. Nature Physics 13, 535 \(2017\)](#)

p- Ω^- interaction

- **HAL QCD p- Ω^- potential** with physical quark masses [T. Iritani et al., Phys. Lett. B 792 \(2019\) 284-289](#)

- $m_\pi = 146 \text{ MeV}/c^2$, $m_K = 525 \text{ MeV}/c^2$

\Rightarrow p- Ω^- attractive interaction at all distances

- No pauli blocking

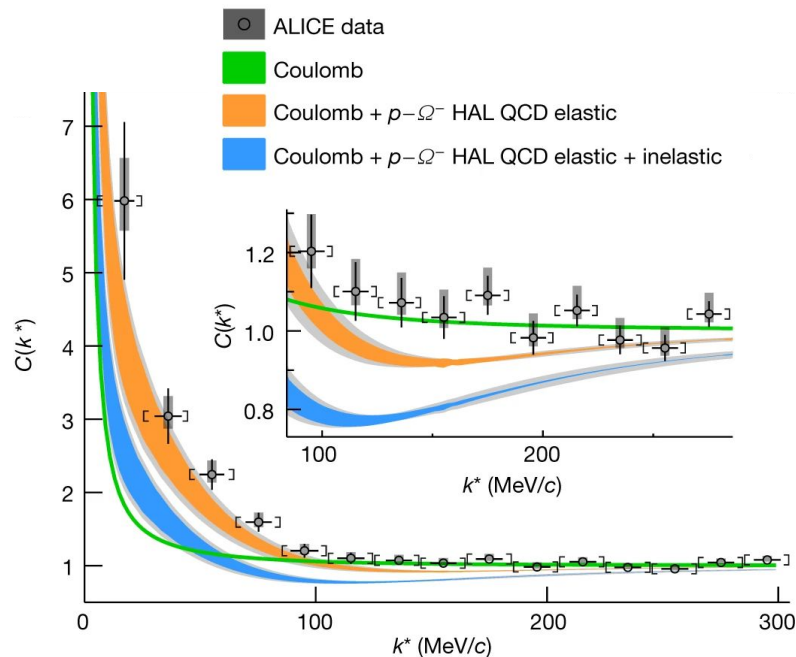

Same behaviour predicted by meson exchange models [T. Sekihara et al., Phys. Rev. C 98, 015205 \(2018\)](#)

- Predicts the formation of a **p- Ω^- di-baryon**:

	HAL QCD: p Ω^- binding energy
Strong interaction	1.5 MeV
Strong + Coulomb	2.5 MeV

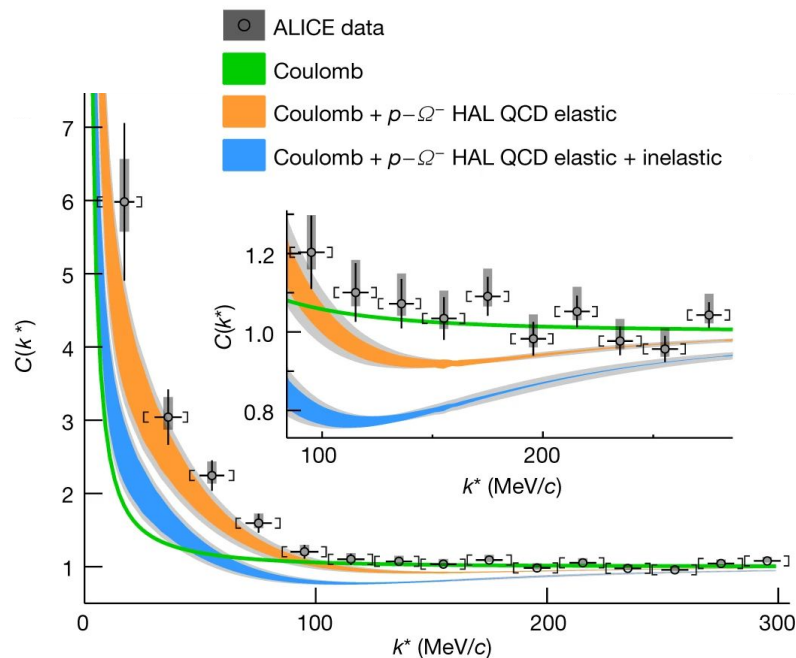

p- Ω^- correlation function in pp at 13 TeV

“Unveiling the strong interaction among hadrons at the LHC”,
[ALICE Coll., Nature 588, 232 \(2020\)](#)

p- Ω^- correlation function in pp at 13 TeV

“Unveiling the strong interaction among hadrons at the LHC”,
[ALICE Coll., Nature 588, 232 \(2020\)](#)

⇒ Evidence of **attractive** strong **interaction** p- Ω^- system

- p- Ω^- correlation function enhanced with respect to p- Λ , p- Ξ^-

⇒ The correlation function in pp collisions at the LHC sensitive to small differences among the interaction potentials (very small sources samples short distances)

⇒ Precise p- Ω^- experimental correlation function provide **first constraint for lattice QCD** calculations:

- Inelastic channels not accounted for quantitatively within the lattice ⇒ two extreme assumptions

⇒ The **data do not follow the depletion** in the correlation function expected due to the p- Ω^- bound states:

- Dependence on the system size

Outlook

- The LHC provides precise testing of the hadron-hadron interaction at distances lower than 1 fm.
- Correlation data complements other approaches.
 - For some channels (multi-strange particles) constitute the only precise data
- First principle calculations of interactions involving hyperons can be tested.
 - Necessary to compute reliable Equations of State and study the existence of strange di-baryons.
- Upcoming LHC data taking will provide the possibility of carrying out new and differential studies and investigate 3-body interactions.
