# prismi esagonali <br> (CaloCube $\rightarrow$ ALADINO) 

Figure 10. Upper, from left to right: the overall assembly of the hexagonal-prism-shape crystals - a total of 15925 elements are foreseen, arranged in 637 lines, each composed by 25 crystals; design of the basic crystal; an example of 19 assembled crystals on the $X-Y$ plane - a 8 mm gap among the crystals allows to accommodate the support structure and, possibly, the read-out system. Lower: design of two adjacent strings of 25 assembled crystals - crystals are staggered by half-length to avoid dead space.

A parità di peso diverse possibilità della configurazione cilindrica (L,D)
