## Current progress in developing key technologies for TianQin project

*Monday, 17 May 2021 08:40 (20 minutes)*

The TianQin project was initiated in 2014. The goal is to launch the space-based gravitational-wave observatory around 2035 and to detect GWs in the frequency range 10<sup>-4</sup>–1 Hz. TianQin consists of three satellites on nearly identical geocentric orbits with radii of the order 105 km, forming a normal triangle constellation. In order to achieve the scientific goals, the nongravitational disturbance on the test masses must be reduced to the order of 10<sup>-15</sup> m/s<sup>2</sup>/Hz<sup>1/2</sup>, and the noise of the displacement measurement with laser interferometry must be reduced to the order of 1 pm/Hz<sup>1/2</sup>. In this talk, we present the current progress of the TianQin project, including updated results of the laser ranging experiment in Zhuhai and the experimental results of TianQin-1 technology demonstration satellite.
