

Global Reconstruction

Matteo Franchini, Roberto Zarrella, Riccardo Ridolfi

FOOT Software meeting

Status

- * Merge of the Genfit GlobalReco branch into master (thanks Alessio for the help)
- * TAGactKFitter is the kalman filter Action class
 - Takes all clusters/points
 - Out: GlobalTrackRepository object → that is a collection of GlobalTrackKalman objects
- * GlobalTrackKalman: class containing all the tracks info (pos, mom, charge, tracking info, ...). It is saved in output ntuple, ready to be used.

Global tracking

- General idea: reconstruct the fragments tracks starting from VT+IT+MSD(+TW) hits using Kalman Filter. Very good performance tested already on MC and old configuration.
- Strategy in pills:
 - Using the interaction point as a seed
 - Starting using clusters from VTX simple straight tracks
 - Extrapolate each one to the IT. Find the closer cluster in 2 possible ways:
 - Form MC PDFs
 - Kalman prefit
 - Redo the same for MSD hits
 - Extrapolate to Scintillator and retrieve the charge -> use it for P evaluation

Ongoing Work

- * Currently rewriting part of the kalman class to make it more flexible and fast. (New branch)
- * Reproduce results obtained with old version of the code
- * We'd like to uniform the global reconstruction output class starting from the TAGtrack class used by TOE. An idea could be:
 - Make it a base parent class (some modification to propose)
 - Use something like TAGtrackTOE and TAGtrackGenfit for specific algorithm variable storing
- * Keep different algorithms in parallel with different performance/setup
