

# TRANSPORT, SELECTION AND PURIFICATION OF SPES SECONDARY BEAM

A. Andrighetto, M. Comunian, A. Dainelli, A. Galatà, F. Moisisio,  
A. M. Porcellato, L. Costa, M. De Lazzari, M. Maggiore, J. Montano,  
L. Calabretta et Al.

# SPES, secondary beam transport layout

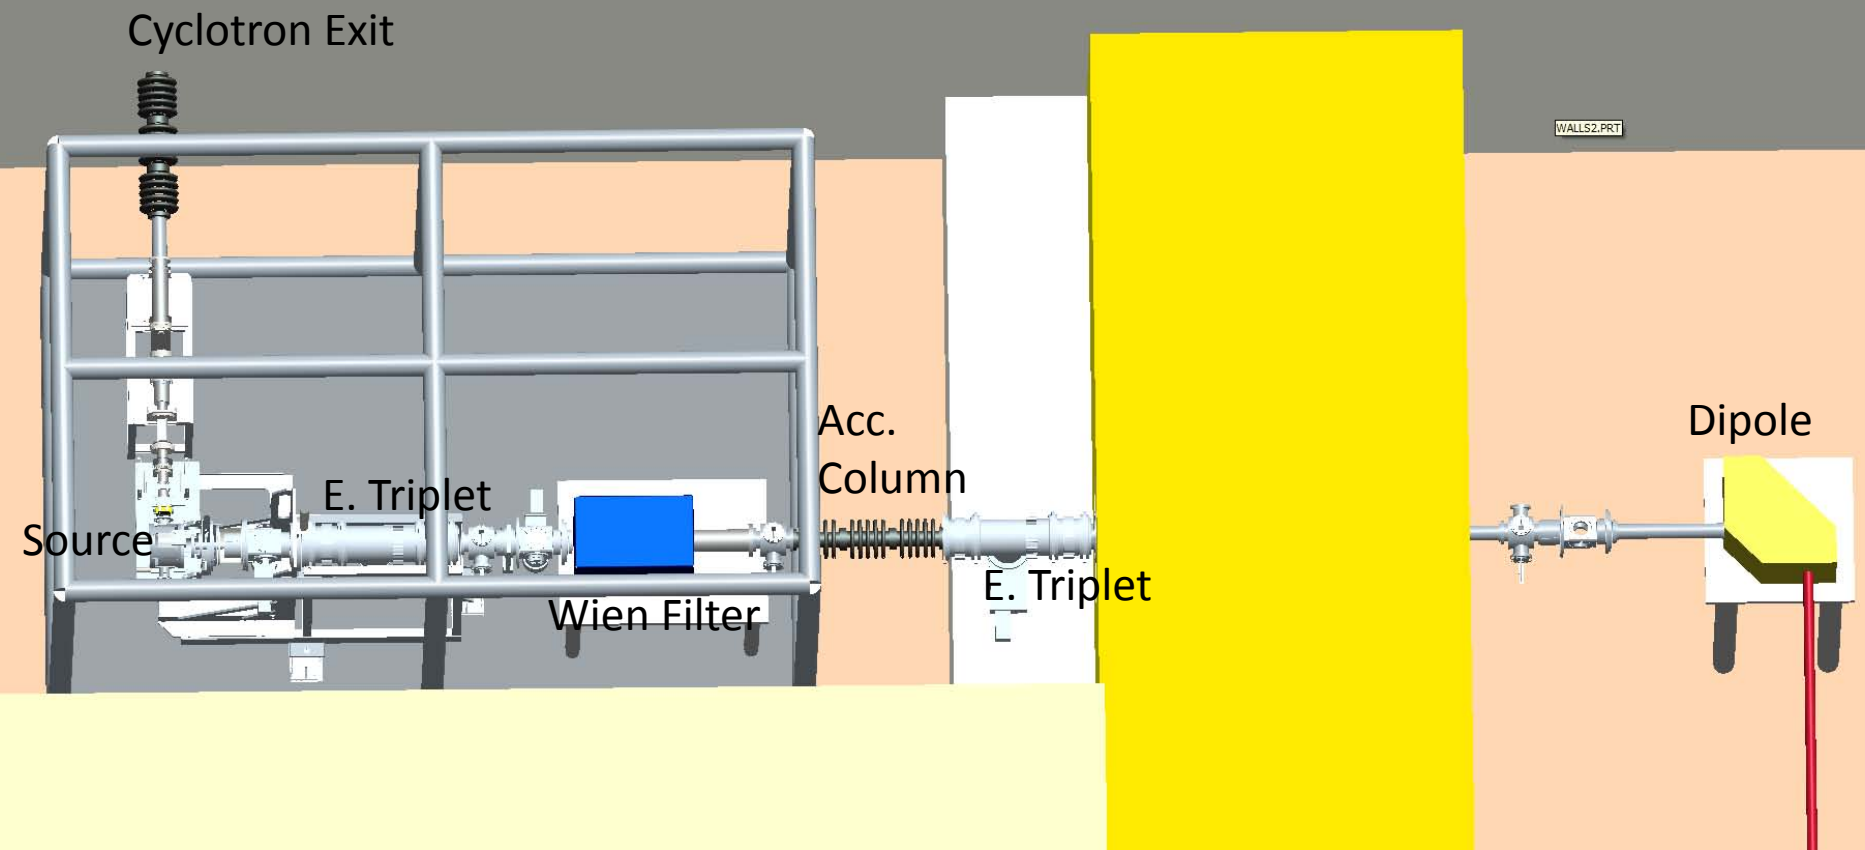

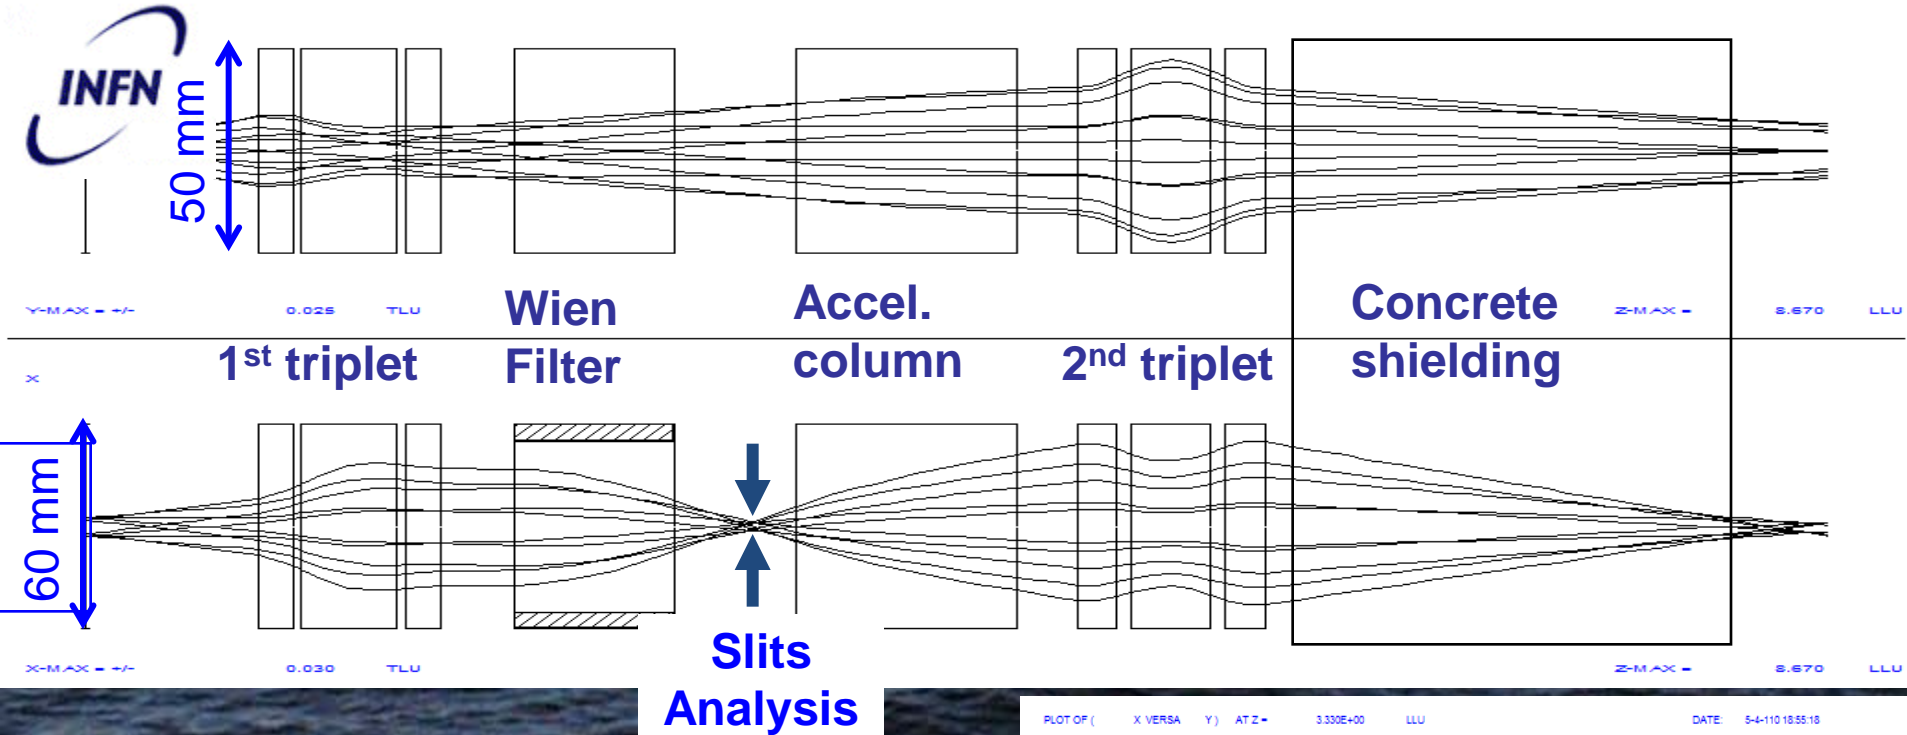

# Design Parameters from Front-End

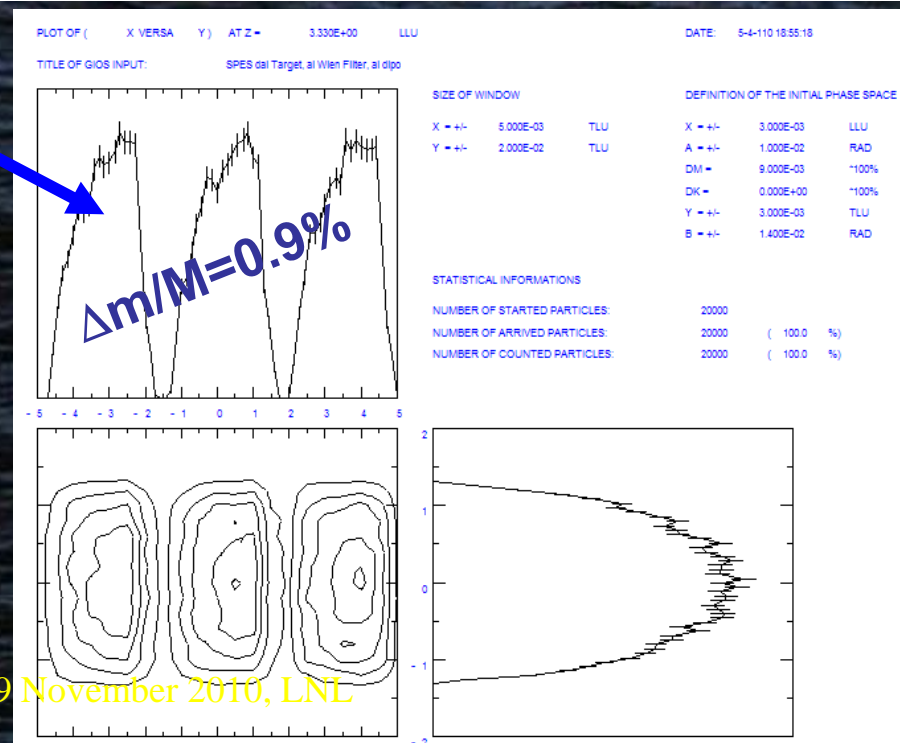

- Plasma Source hole of 6 mm
- Total Emittance(100%)=30  $\pi$ mmrad @ 60 keV
- RMS Norm. Emitt. =0.013 mmmrad
- Ion: Tin 132, 1+ (18+ after charge breeder)
- BetaX=BetaY=0.66 mm/mrad. AlfaX= AlfaY=-1
- Bp=0.405 Tm @ 60 keV
- Bp=0.84 Tm @ 260 keV

# Front-End & Transport Line

**Simulation include  
3 order effects**

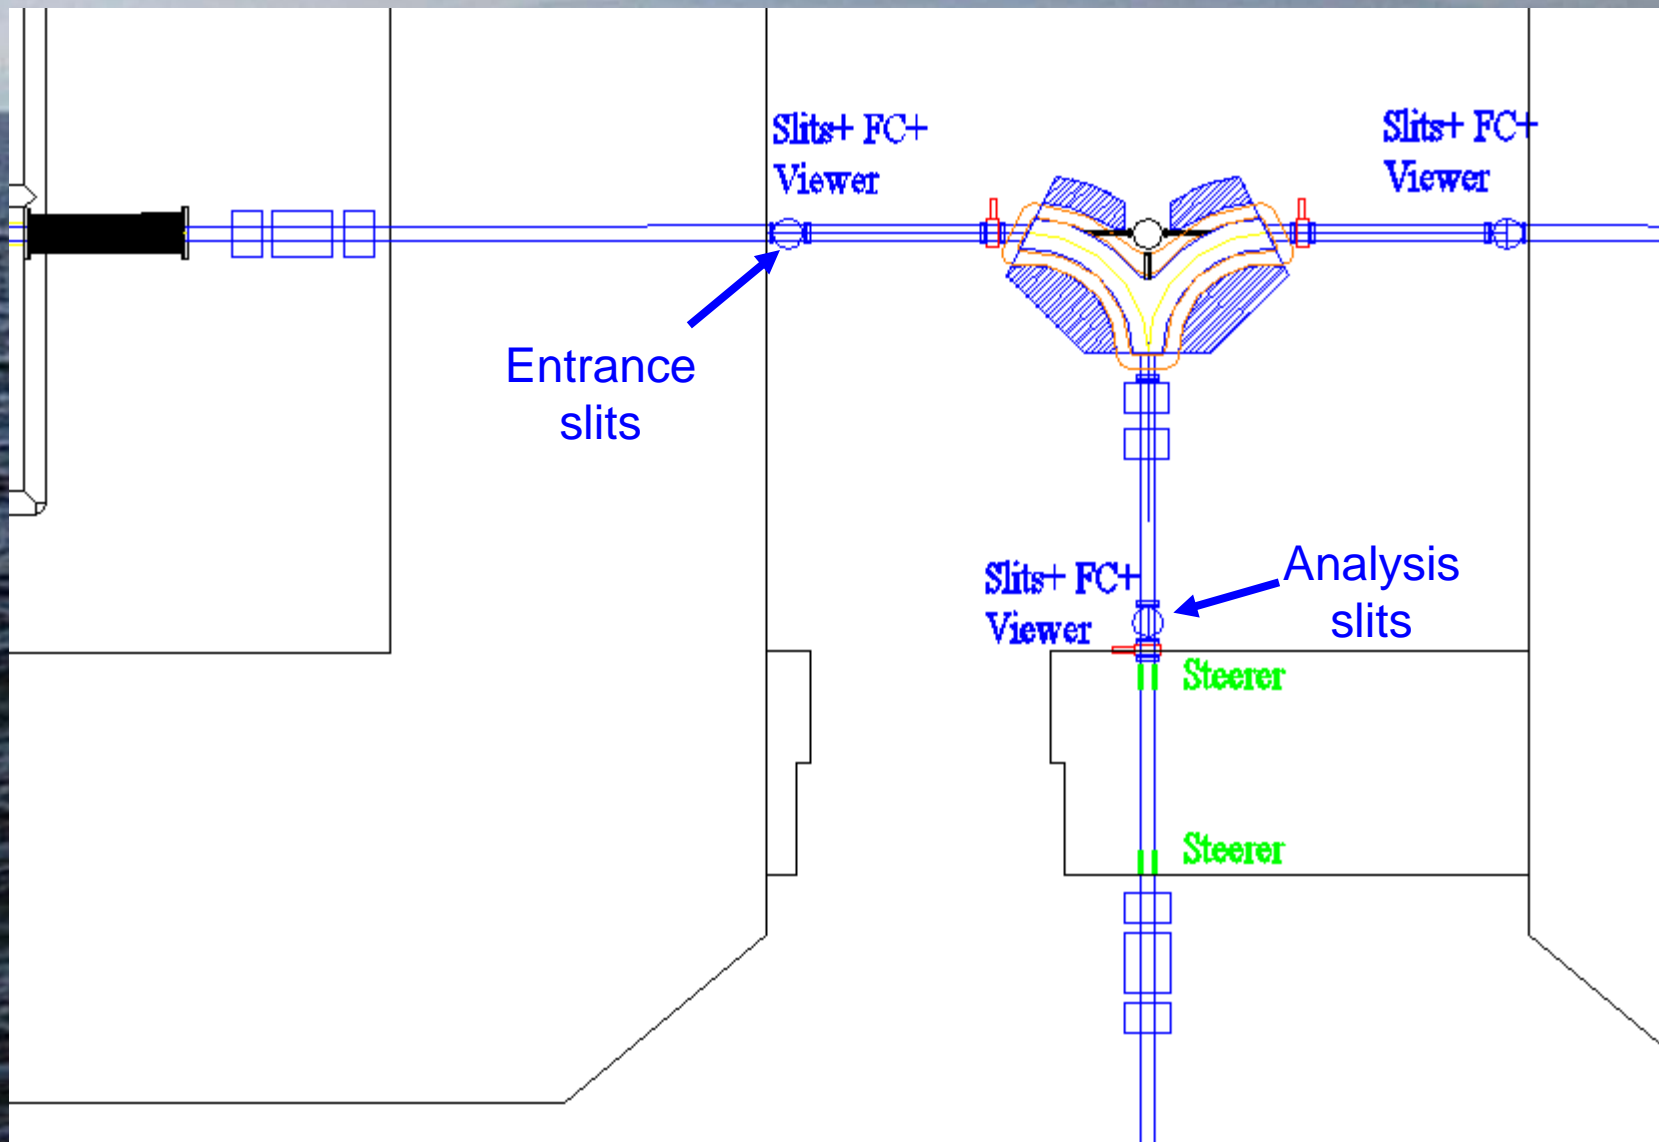

# Wien filter parameters

<b>Magnetic field</b>	<b>0.6 T</b>
<b>Effective length</b>	<b>0.8 m</b>
<b>Pole Gap</b>	<b>130 mm</b>
<b>Pole width</b>	<b>330 mm</b>
<b>Electric field</b>	<b>2 kV/cm</b>
<b>Max. Voltage</b>	<b>+/- 5 kV</b>
<b>Electrodes gap</b>	<b>50 mm</b>
<b>Electrodes width</b>	<b>100 mm</b>

In this area a mirror will be installed, to drive the laser light to the Light Ion Source

Cryotraps (SPIRAL like) to frozen the contaminant gas

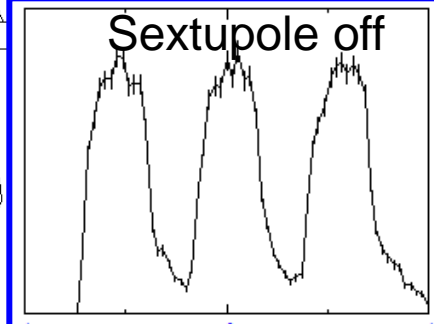

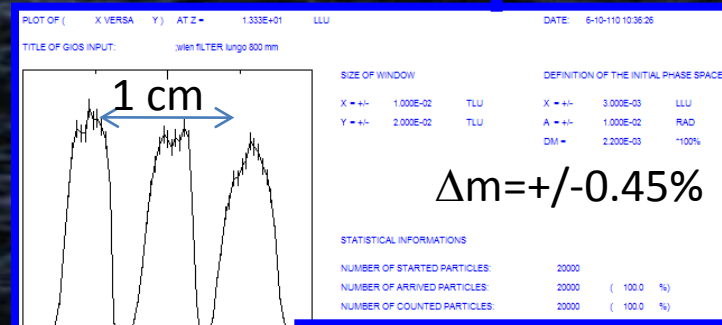

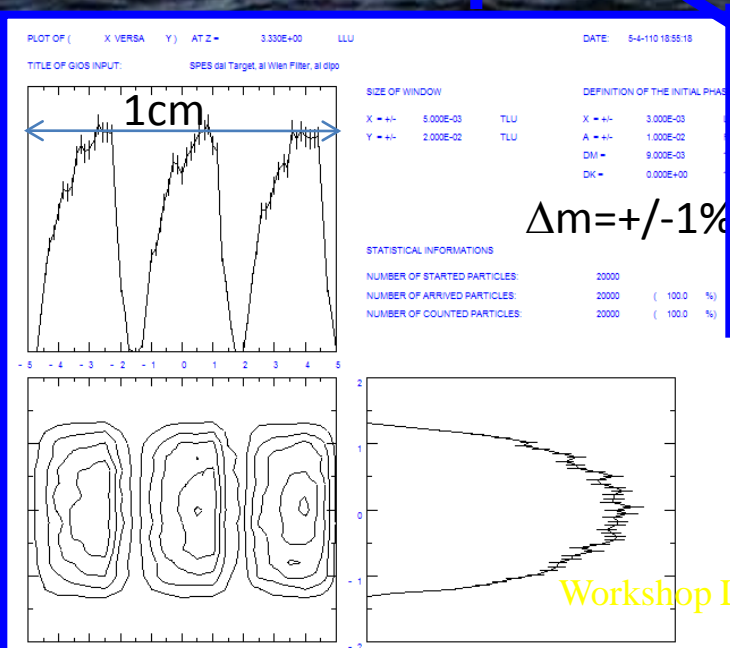

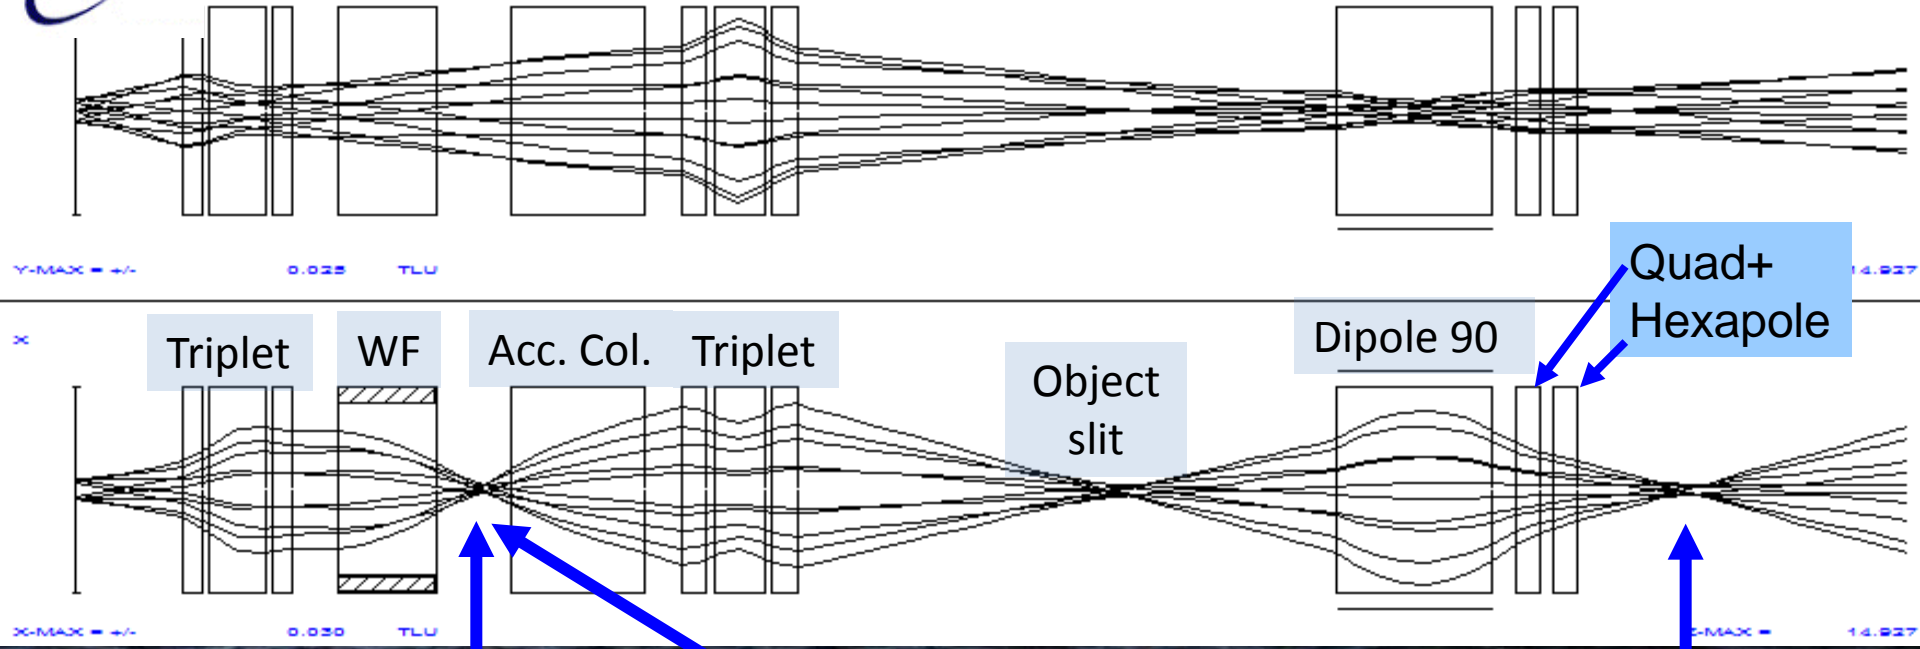

Vertical focusing Quad + Sextupole corrector

Dipole 90  
 bending radius 800mm  
 $B_{max} = 1.2 \text{ T}$   
 Gap = 30 mm  
 Entrance face tilted 35

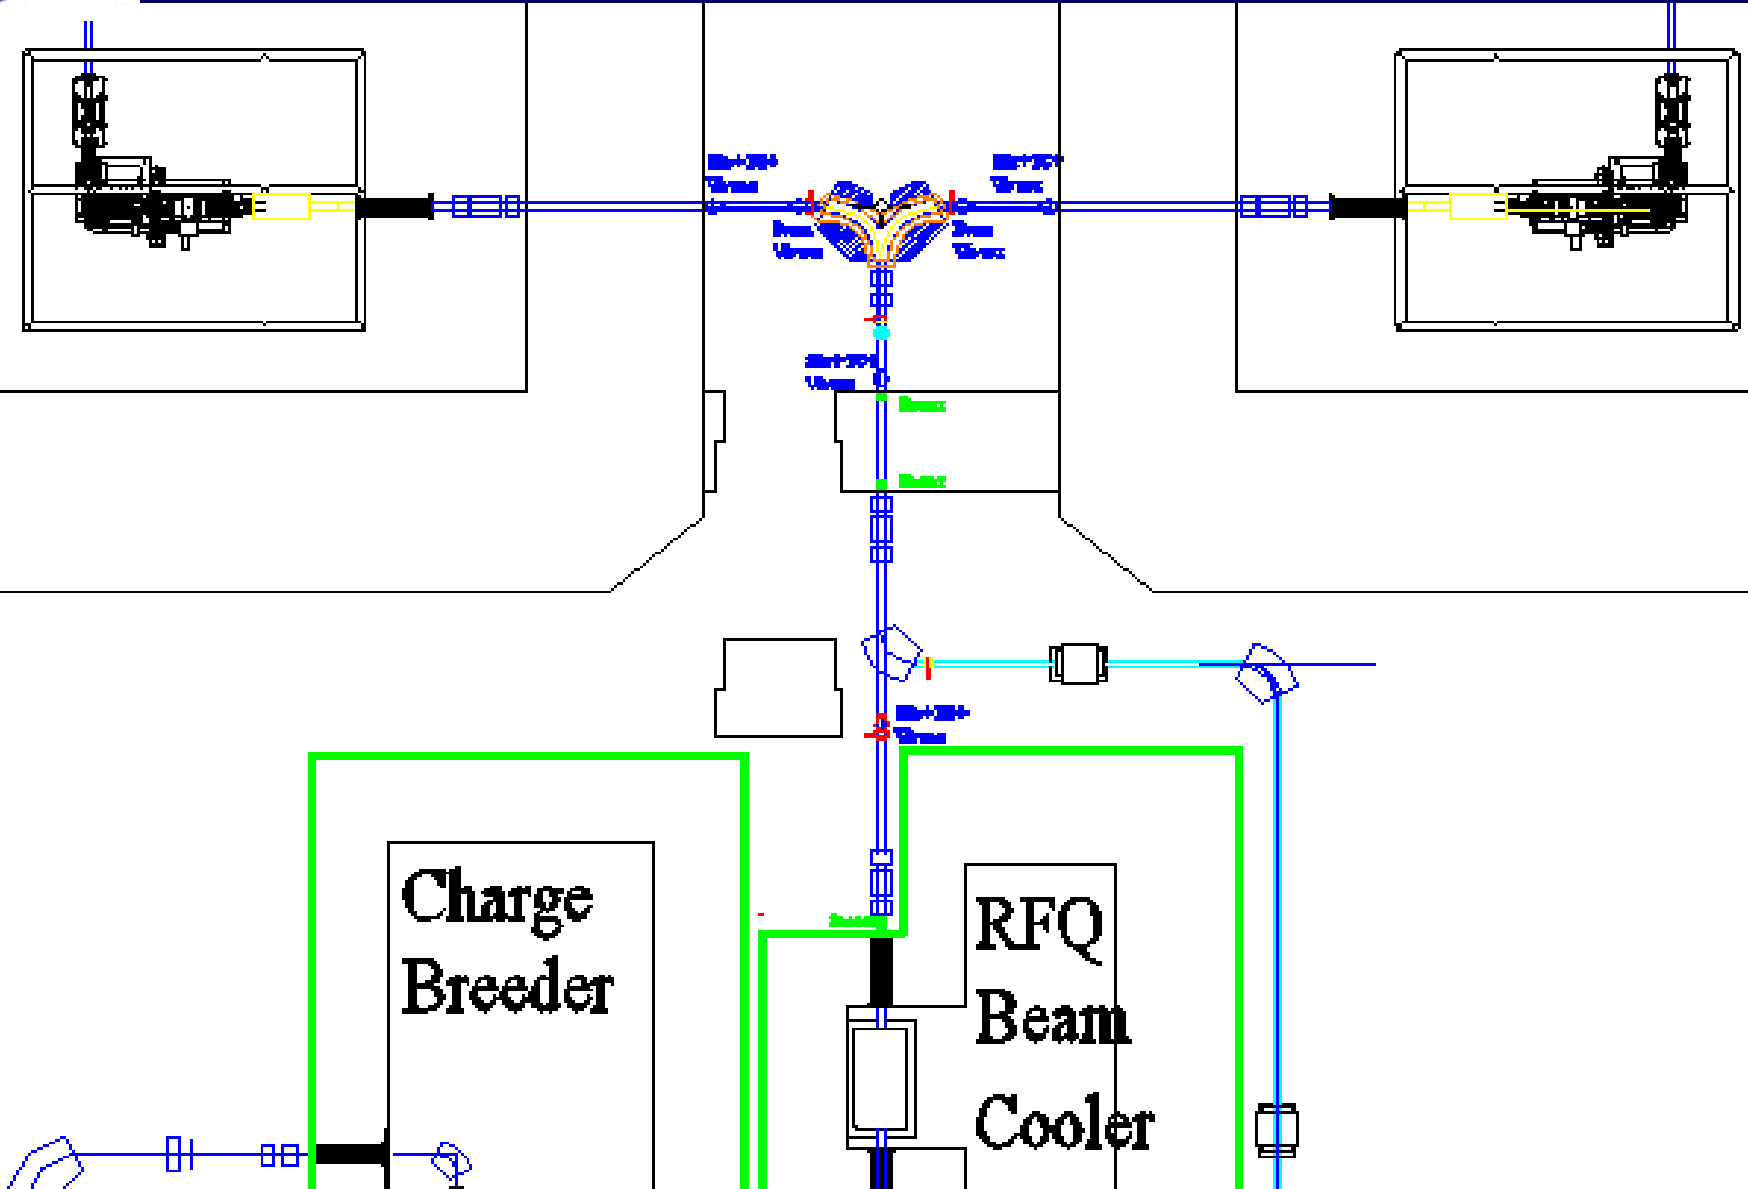

# GIOS Results, 3° Order

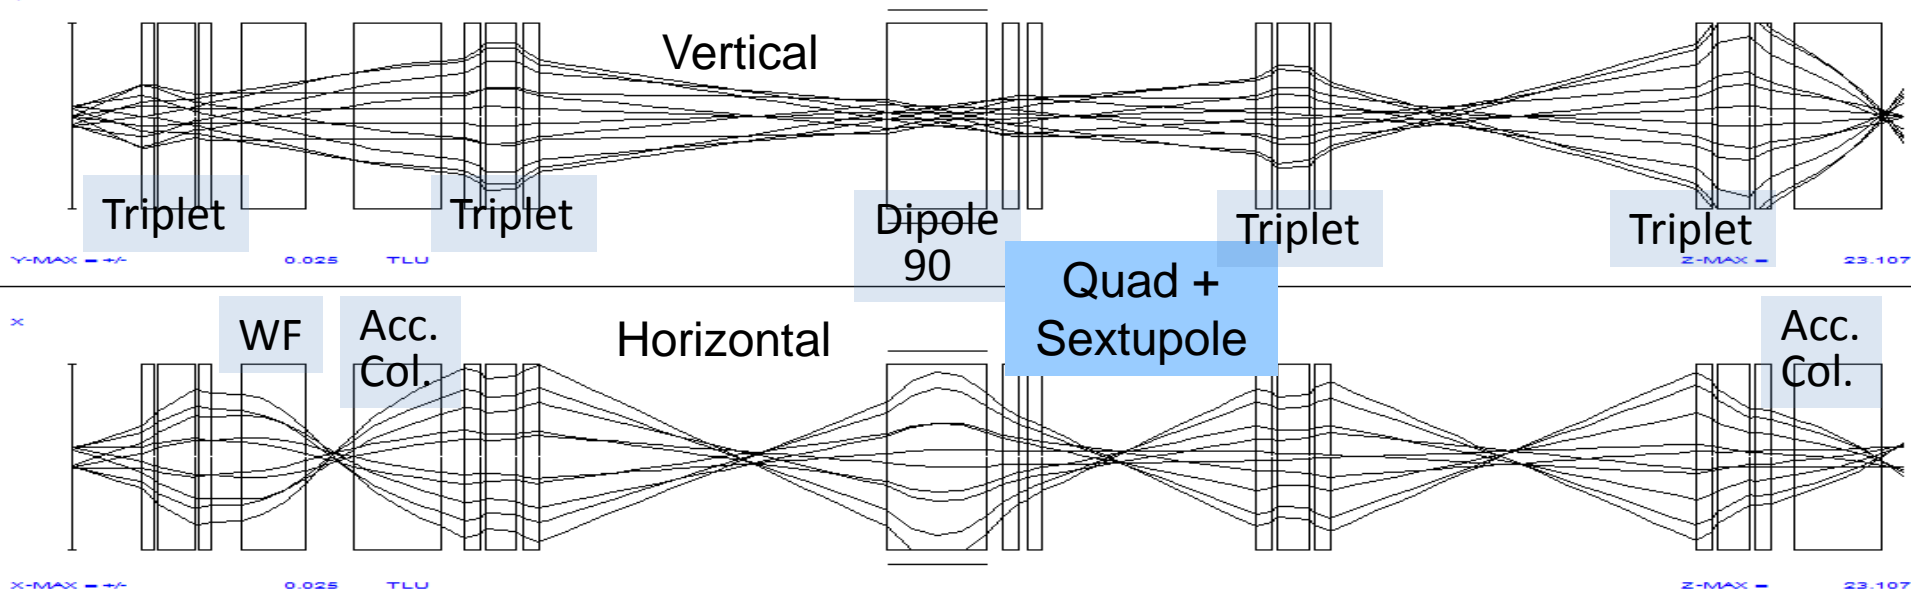

# Update Transport Line to RFQ Cooler

# Beam Envelope, sextupole OFF

# Beam Envelope, sextupole ON

# Energy Profile from Front-End to RFQ Cooler

# Why we need a Beam Cooler?

## Beam parameters delivered by the source

- Intensity  $\sim 2 \mu\text{A}$  (at source), after the Wien filter  $\sim 400 \text{ nA}$
- $9 < A < 170$
- Emittance  $< 30 \pi \text{ mm.mr}$  @ 60 keV, for LIS source  $3 \pi \text{ mm.mrad}$
- $\Delta E = 2 \div 3 \text{ eV}$  intrinsic + voltage platform ripple

Cooler Acceptance

COOLING

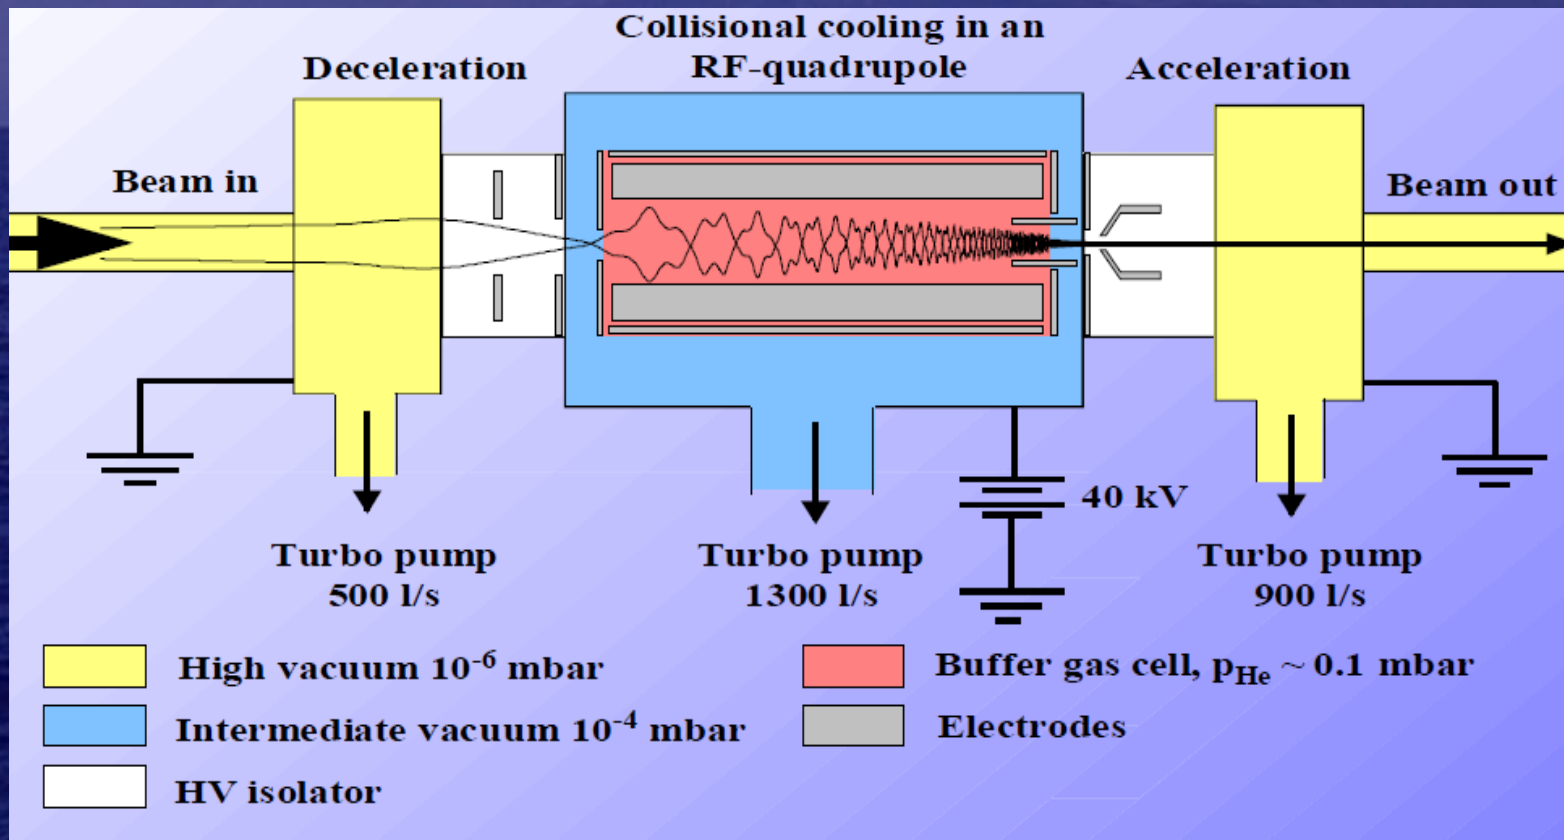

Beam delivered

- INTENSITY: as high as possible
- Emittance  $< 2 \pi \text{ mm.mr}$  @ 260 keV
- $\Delta E < 1 \text{ eV}$

# Buffer-gas filled RFQ trap

To reduce transversal emittance and energy spread  
 → to improve resolving power of Mass separator

# REGATA, feasibility study founded by 5<sup>th</sup> CSN

Ion Mass =  $9 < A < 170$   
 Current = up to 100 nA (actual limit)  
 $\approx 1 \mu\text{A}$  (challenging)

HV platform

**DIFFERENTIAL PUMPING SYSTEM**

HIGH INTENSITY BEAM COOLING

SPACE CHARGE EFFECT

MAGNETIC CONFINEMENT ?

RFQ RADIAL CONFINEMENT HAS TO BE INCREASED

RFQ HIGHER VOLTAGE

RFQ HIGHER FREQUENCY

RF BREAKDOWN IN HIGH PRESSURE GAS ENVIR. ?

REDUCING GAS PRESSURE AT CRYOGENIC TEMP. (Barquest, MSU)

**REGATA,  
feasibility study  
founded by  
5<sup>th</sup> CSN**

# What mass resolving power we need?

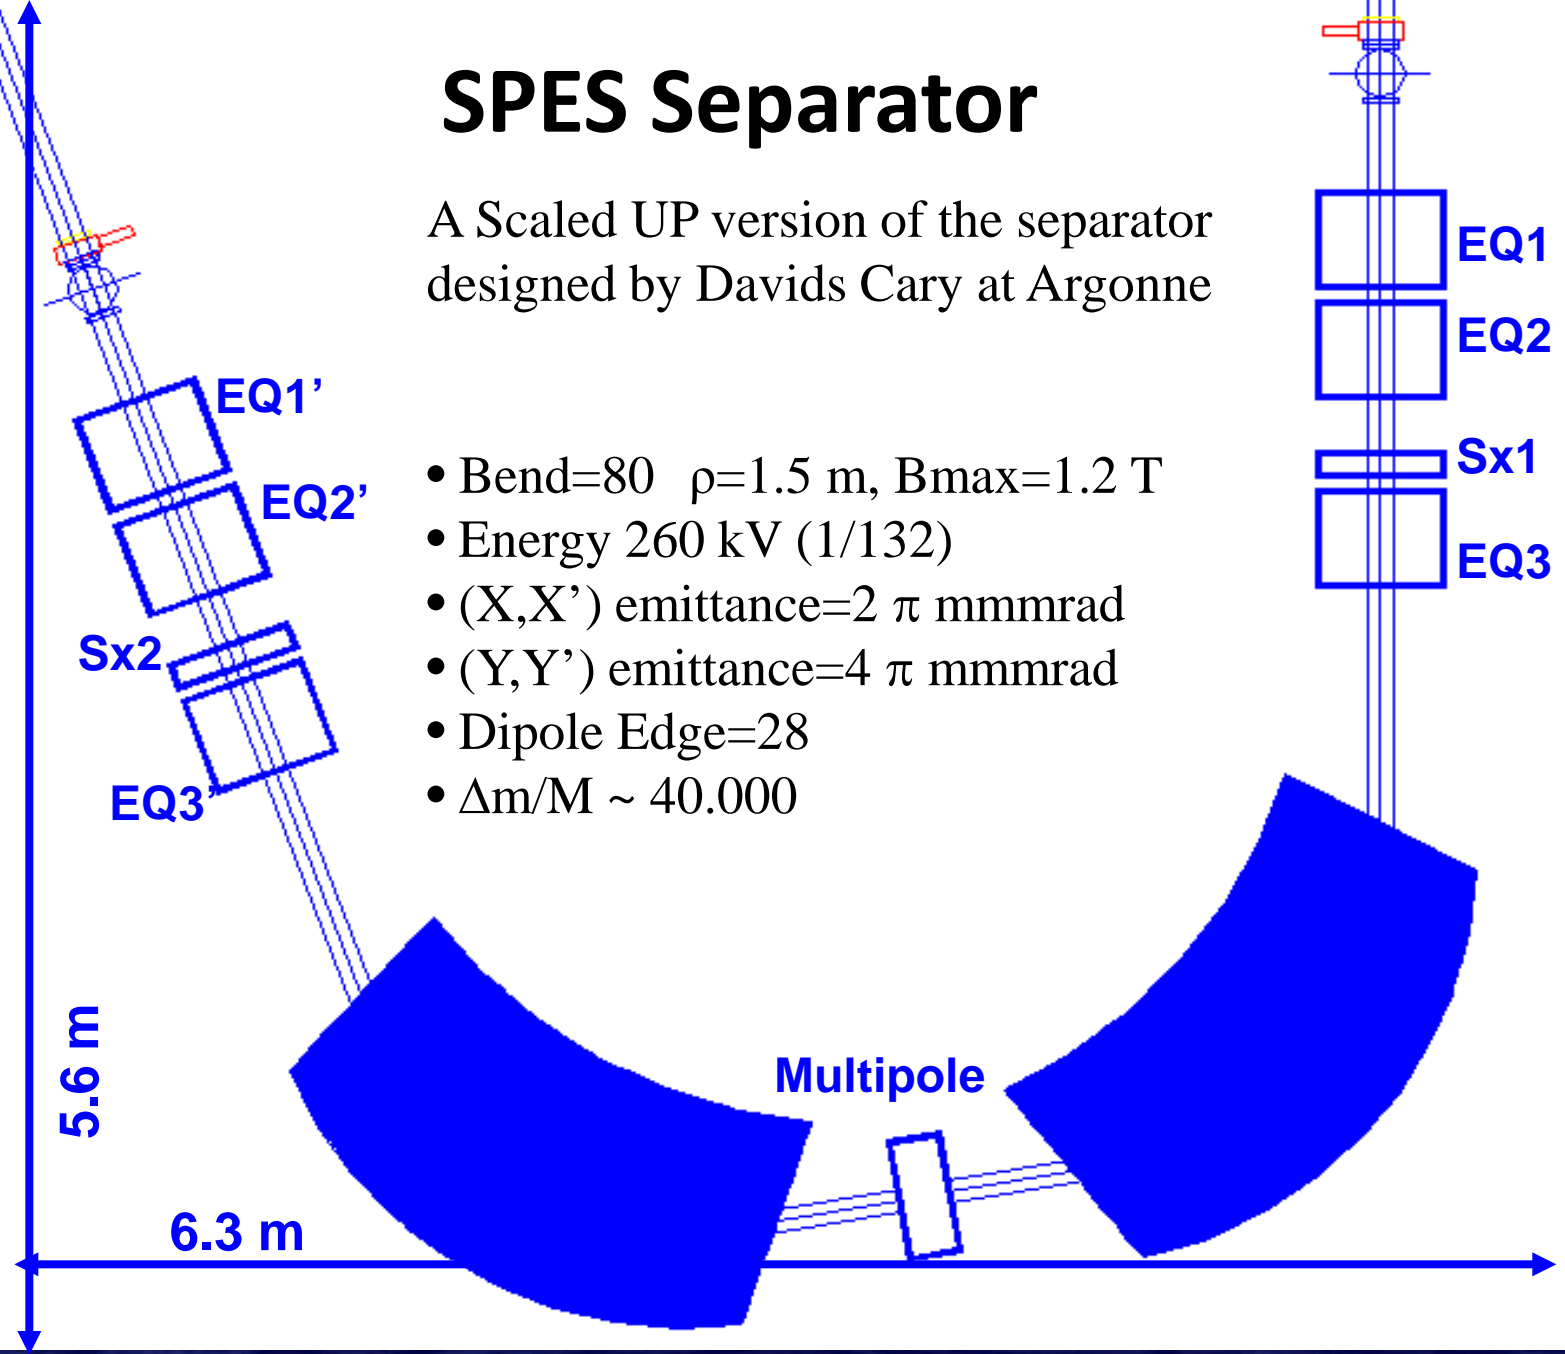

**Despite a mass resolving power of 30.000 seems enough, it is more conservative to achieve higher values to reduce the tails of contaminant with higher yields**

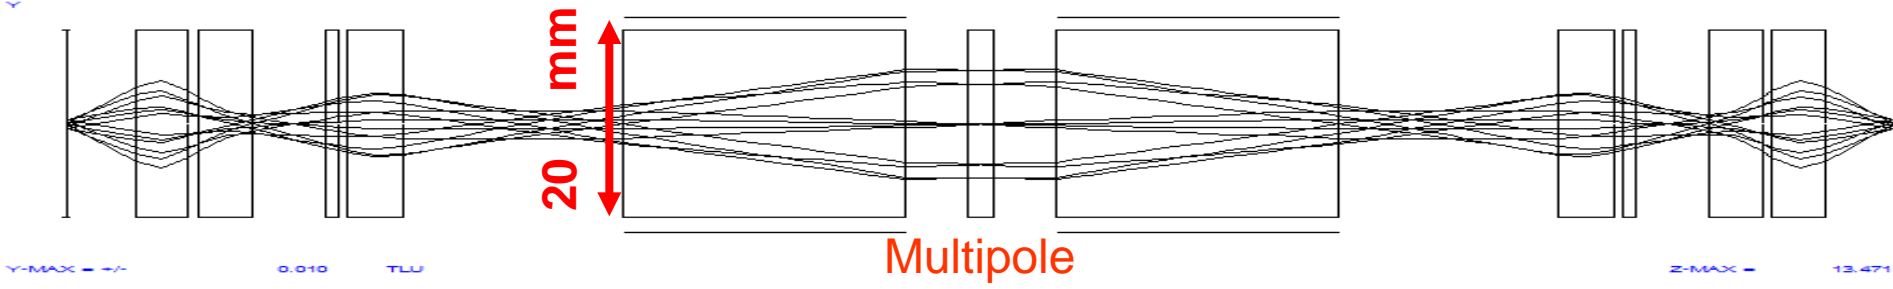

# SPES Separator

A Scaled UP version of the separator designed by Davids Cary at Argonne

- Bend=80  $\rho=1.5$  m,  $B_{max}=1.2$  T
- Energy 260 kV (1/132)
- (X,X') emittance= $2 \pi$  mmmrad
- (Y,Y') emittance= $4 \pi$  mmmrad
- Dipole Edge=28
- $\Delta m/M \sim 40.000$

# Beam envelope by GIOS code @ 3<sup>rd</sup> order

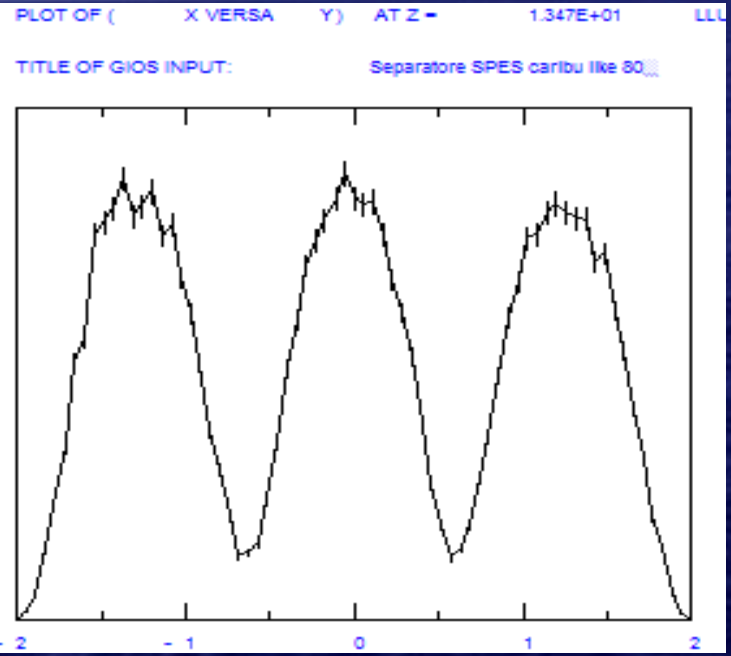

**Beam emittance**  
 $(x, x') = 2\pi \text{ mm.mrad}$   
 $(y, y') = 4\pi \text{ mm.mrad}$

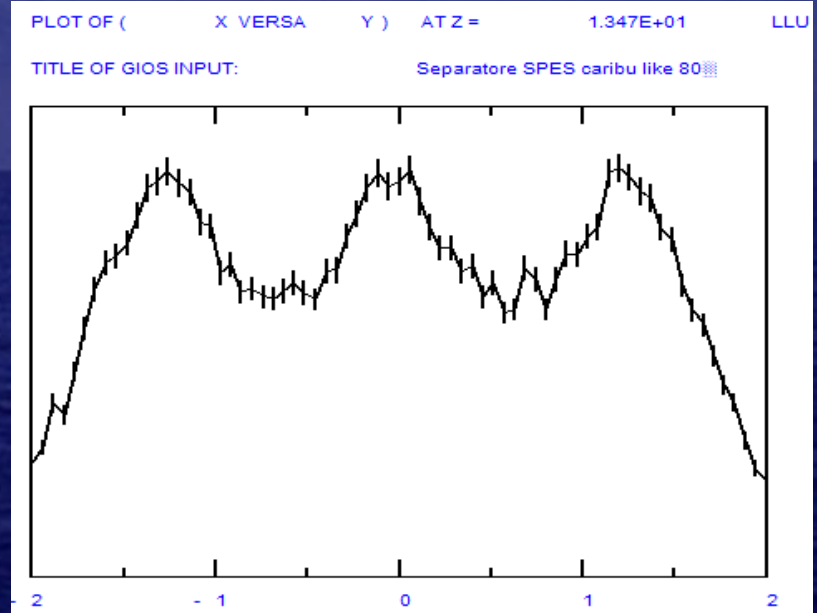

**Without energy spread**

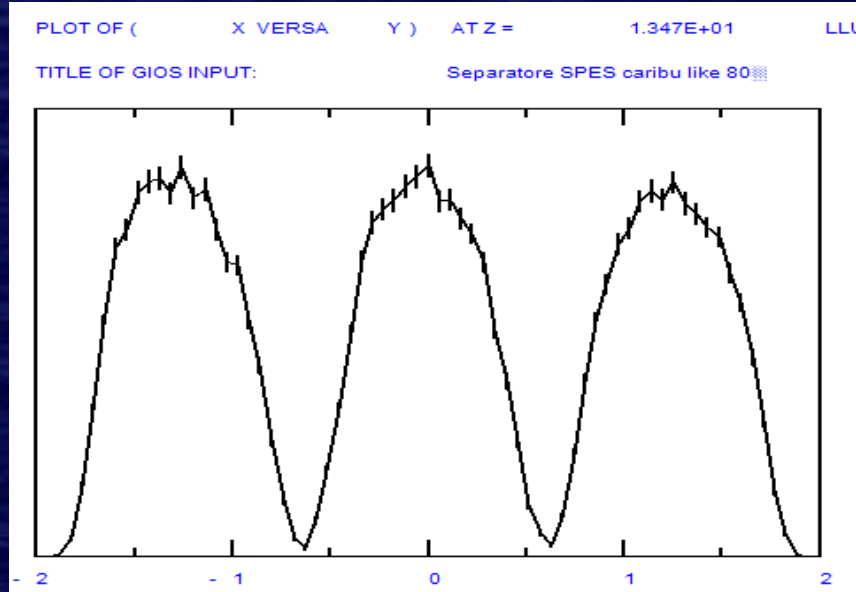

energy spread 1 eV/260 kV

$$\Delta m/M = 1/40.000$$

energy spread 0.5 eV/260 kV

# What happened if the beam cooler is off?

The beam emittance will be about  $10 \pi$  mm.mrad in both the planes, larger than the values  $2 \pi$  mm.mrad we assumed.

We can not change the magnets parameters, so we have to match the larger beam emittance in the separator acceptance!

Simplest way is to increase the size of the beam at the object and then at the image position. We change the beam size from 1 mm  $\rightarrow$  5 mm

**Resolving power decrease from 40000  $\rightarrow$  8000**

# Next Steps

- Finalize the design of Spectrometer
- Errors Study
- Platforms Design
- Beam Cooler Study and Design
- Spectrometer Engineering Design

**and That's All Folk ...**

**Thank you for your attention!**
