LHC machine layout simulations

Experimental results at SPS

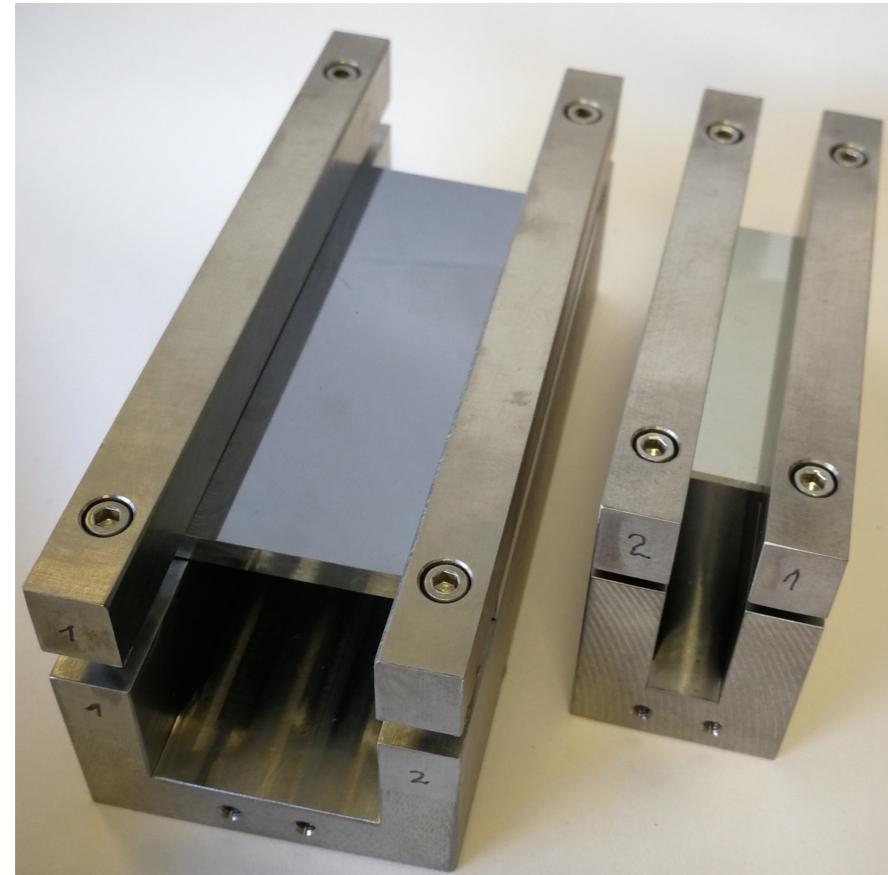

W. Scandale et al., PLB 758 (2016) 129–133

- **Channeling** of 6.5 TeV at LHC already **demonstrated** by UA9
- **Viable layout:** 10^6 p/s on target close to LHCb. Possibility to improve performance with a dedicated experiment at LHC
- Successful **layout test** done at SPS. Test in **LHC** possibly during Run3

- **Si** and **Ge** long bent crystals developed at INFN-Ferrara.
Channeling efficiency >10% for 180 GeV/c pions

Fixed-target setup upstream of LHCb

- ▶ Goniometer for target+crystal positioned in the region upstream of the LHCb detector

- ▶ Goniometer internal structure: compatible with operations in ultra-high vacuum
- ▶ Accuracy on position $\sim 20 \mu\text{m}$, rotation angle $\sim 20 \mu\text{rad}$

Production of Λ_c^+ baryons

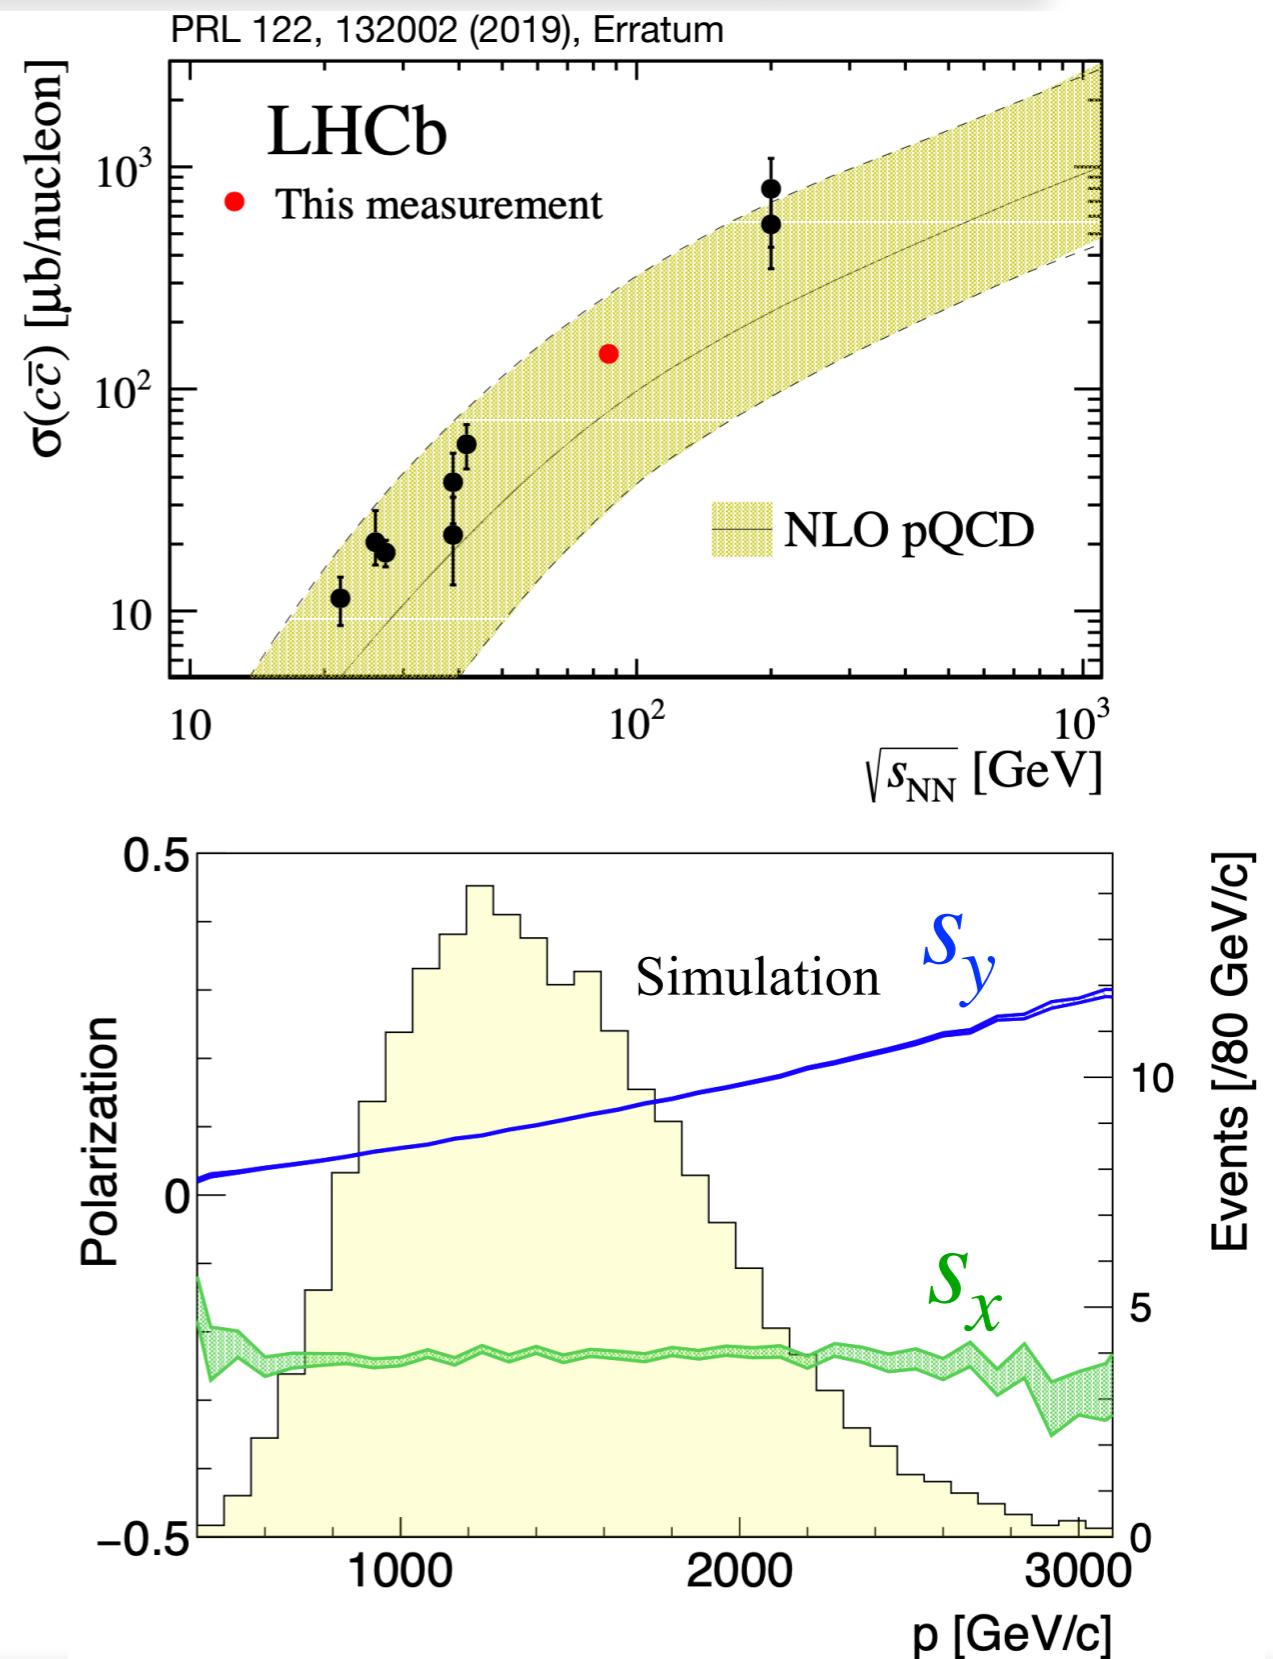

Measured $c\bar{c}$ cross-section at $\sqrt{s_{NN}} = 86.6 \text{ GeV}$ - $\sigma_{c\bar{c}} = 144 \pm 12.1 \pm 3.5 \mu\text{b}/\text{nucleon}$

Expected Λ_c^+ **cross-section** at $\sqrt{s}=115 \text{ GeV}$: $\sigma(\Lambda_c^+) \sim 11 \mu\text{b}$

Λ_c^+ **polarization** measurements ongoing using p-Gas collisions (signal yield of few hundreds)

Momentum and polarization for Λ_c^+ baryons produced in fixed-target (Ge crystal at 293 K)

S_y and S_x polarisations for Λ_c^+ baryons with $\theta_{y,C}=0.3 \text{ mrad}$ between impinging p and crystal

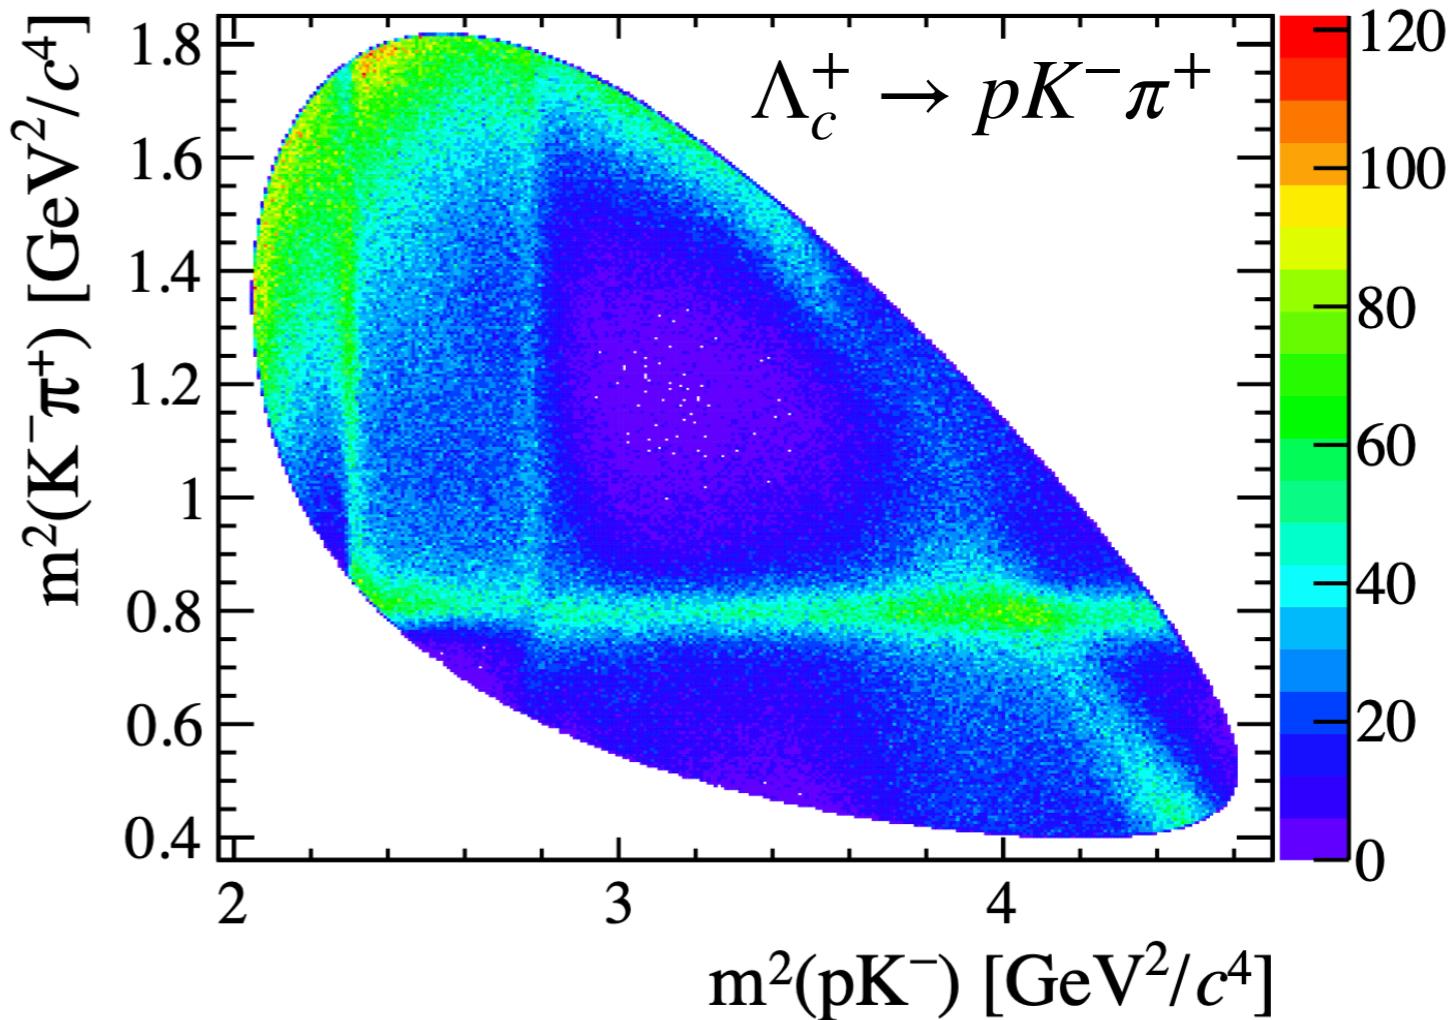

Use copious Λ_c^+ , Ξ_c^+ 3-body decays

- ▶ Use many 3-body decays to increase the signal yield
- ▶ Extract maximum information via full amplitude analysis of the 3-body decays D. Marangotto, AHEP (2020) 7463073
