Flavour and the Higgs in a Warped Extra Dimension

Monday, 6 December 2010 15:25 (25 minutes)

The Randall-Sundrum model features one compact extra dimension and is suitable for stabilizing the electroweak scale. I discuss its interesting phenomenological implications for CP violation in kaon mixing and rare decays and the interplay between different observables, with remarks on model-specific protection mechanisms. I also comment on possible effects from deviations in the Higgs couplings to fermions and their implications.
