Bs decays at Belle

Friday, 10 December 2010 15:15 (25 minutes)

The B-factories have successfully exploited the unique advantages of the Upsilon(4S) resonance to study many aspects of B_d and B_u mesons. The Upsilon(10860) (aka Upsilon(5S)) resonance, which is above mass threshold for the B_s and shares many of the same advantages, has been relatively unexplored. The Belle experiment has collected more than 120 fb⁻¹ at the Upsilon(10860). Recent results based on ~20% of these data are presented and prospects for future possibilities discussed.
