## **Recent results on hadronic resonance production with the ALICE experiment**

*Thursday, 16 September 2021 16:50 (20 minutes)*

Short-lived hadronic resonances are good probes to investigate the late-stage evolution of ultra-relativistic heavy ion collisions. Since they have lifetimes comparable to that of the fireball, the measured yields may be affected by rescattering and regeneration processes in the hadronic phase, which modifies the particle's momentum distributions after hadronization. Measurements of the production of resonances characterized by different lifetimes, masses, quark content, and quantum numbers can be used to explore the different mechanisms that influence the shape of particle momentum spectra, the dynamical evolution and lifetime of the hadronic phase, strangeness production, and collective effects. Furthermore, a multiplicity dependent analysis on resonance production in pp and p-Pb collisions could highlight the possible onset of collective-like phenomena even in small systems. The ALICE experiment has collected data from several collision systems at LHC energies and the latest results on hadronic resonance production will be presented.

**Presenter:** ROSANO, Antonina (Istituto Nazionale di Fisica Nucleare)

**Session Classification:** Oral Presentations
