Collider physics: the next steps

Michelangelo L. Mangano
Theory Department,
CERN, Geneva

The next steps in HEP build on

- having important questions to pursue
- creating opportunities to answer them
- being able to constantly add to our knowledge, while seeking those answers

The important questions

Data driven:

- DM
- Neutrino masses
- Matter vs antimatter asymmetry
- Dark energy
- ...

Theory driven:

- The hierarchy problem and naturalness
- The flavour problem (origin of fermion families, mass/mixing pattern)
- Quantum gravity
- Origin of inflation
- ...

• For none of these questions, the path to an answer is unambiguously defined.

- For none of these questions, the path to an answer is unambiguously defined.
- Two examples:

- For none of these questions, the path to an answer is unambiguously defined.
- Two examples:
 - \bullet DM: could be anything from fuzzy 10^{-22} eV scalars, to O(TeV) WIMPs, to multi-M_{\odot} primordial BHs, passing through axions and sub-GeV DM

- For none of these questions, the path to an answer is unambiguously defined.
- Two examples:
 - DM: could be anything from fuzzy 10^{-22} eV scalars, to O(TeV) WIMPs, to multi-M_{\odot} primordial BHs, passing through axions and sub-GeV DM
 - a vast array of expts is needed, even though most of them will end up empty-handed...

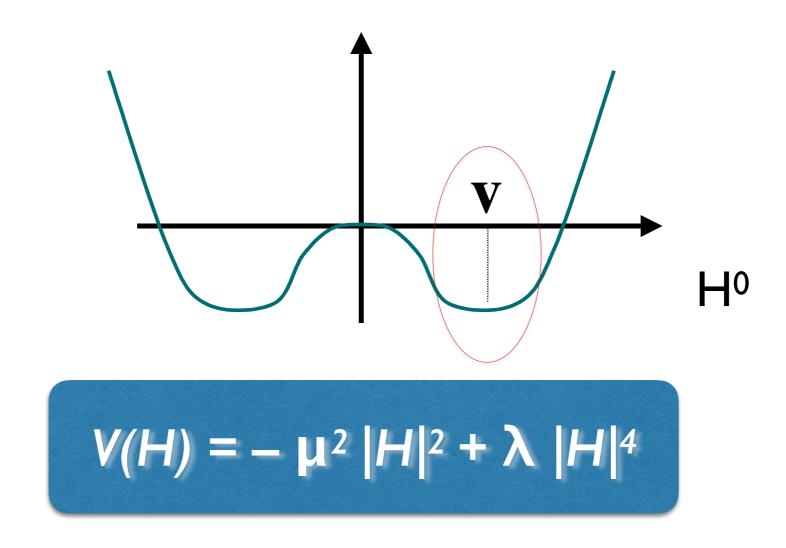

- For none of these questions, the path to an answer is unambiguously defined.
- Two examples:
 - DM: could be anything from fuzzy 10^{-22} eV scalars, to O(TeV) WIMPs, to multi-M_{\odot} primordial BHs, passing through axions and sub-GeV DM
 - a vast array of expts is needed, even though most of them will end up empty-handed...
 - Neutrino masses: could originate anywhere between the EW and the GUT scale

- For none of these questions, the path to an answer is unambiguously defined.
- Two examples:
 - DM: could be anything from fuzzy 10^{-22} eV scalars, to O(TeV) WIMPs, to multi-M_{\odot} primordial BHs, passing through axions and sub-GeV DM
 - a vast array of expts is needed, even though most of them will end up empty-handed...
 - Neutrino masses: could originate anywhere between the EW and the GUT scale
 - we are still in the process of acquiring basic knowledge about the neutrino sector: mass hierarchy, majorana nature, sterile neutrinos, CP violation, correlation with mixing in the charged-lepton sector ($\mu \rightarrow e\gamma$, $H \rightarrow \mu \tau$, ...): as for DM, a broad range of options

- For none of these questions, the path to an answer is unambiguously defined.
- Two examples:
 - DM: could be anything from fuzzy 10^{-22} eV scalars, to O(TeV) WIMPs, to multi-M_{\odot} primordial BHs, passing through axions and sub-GeV DM
 - a vast array of expts is needed, even though most of them will end up empty-handed...
 - Neutrino masses: could originate anywhere between the EW and the GUT scale
 - we are still in the process of acquiring basic knowledge about the neutrino sector: mass hierarchy, majorana nature, sterile neutrinos, CP violation, correlation with mixing in the charged-lepton sector ($\mu \rightarrow e\gamma$, $H \rightarrow \mu \tau$, ...): as for DM, a broad range of options
- We cannot objectively establish a hierarchy of relevance among the fundamental questions. The hierarchy evolves with time (think of GUTs and proton decay searches!) and is likely subjective. It is also likely that several of the big questions are tied together and will find their answer in a common context (eg DM and hierarchy problem, flavour and nu masses, quantum gravity/inflation/dark energy, ...)

But there is one question that can only be addressed by colliders, and future collider efforts must focus on its thorough exploration

But there is one question that can only be addressed by colliders, and future collider efforts must focus on its thorough exploration

Where does this come from?

a historical example: superconductivity

a historical example: superconductivity

• The relation between the Higgs phenomenon and the SM is similar to the relation between superconductivity and the Landau-Ginzburg theory of phase transitions: a quartic potential for a bosonic order parameter, with negative quadratic term, and the ensuing symmetry breaking. If superconductivity had been discovered after Landau-Ginzburg, we would be in a similar situations as we are in today: an experimentally proven phenomenological model. But we would still lack a deep understanding of the relevant dynamics.

a historical example: superconductivity

- The relation between the Higgs phenomenon and the SM is similar to the relation between superconductivity and the Landau-Ginzburg theory of phase transitions: a quartic potential for a bosonic order parameter, with negative quadratic term, and the ensuing symmetry breaking. If superconductivity had been discovered after Landau-Ginzburg, we would be in a similar situations as we are in today: an experimentally proven phenomenological model. But we would still lack a deep understanding of the relevant dynamics.
- For superconductivity, this came later, with the identification of e⁻e⁻Cooper pairs as the underlying order parameter, and BCS theory. In particle physics, we still don't know whether the Higgs is built out of some sort of Cooper pairs (composite Higgs) or whether it is elementary, and in both cases we have no clue as to what is the dynamics that generates the Higgs potential. With Cooper pairs it turned out to be just EM and phonon interactions. With the Higgs, none of the SM interactions can do this, and we must look beyond.

examples of possible scenarios

- BCS-like: the Higgs is a composite object
- Supersymmetry: the Higgs is a fundamental field and
 - λ^2 ~ $g^2+g'^2$, it is not arbitrary (MSSM, w/out susy breaking, has one parameter less than SM!)
 - potential is fixed by susy & gauge symmetry
 - \bullet EW symmetry breaking (and thus m_H and $\lambda)$ determined by the parameters of SUSY breaking

• ...

• The search for the origin of the Higgs and EW symmetry breaking is justified independently of prejudice on the relevance of theoretical puzzles like the hierarchy problem

- The search for the origin of the Higgs and EW symmetry breaking is justified independently of prejudice on the relevance of theoretical puzzles like the hierarchy problem
- It is reasonable to expect that the dynamics underlying the Higgs phenomenon sits nearby the EW scale, justifying the yet unfulfilled hope that new physics should be seen by LHC...

- The search for the origin of the Higgs and EW symmetry breaking is justified independently of prejudice on the relevance of theoretical puzzles like the hierarchy problem
- It is reasonable to expect that the dynamics underlying the Higgs phenomenon sits nearby the EW scale, justifying the yet unfulfilled hope that new physics should be seen by LHC...
- .. thus many theoretical ideas are emerging, postponing to much higher energies or to alternative scenarios the framework to understand the origin of the weak scale

- The search for the origin of the Higgs and EW symmetry breaking is justified independently of prejudice on the relevance of theoretical puzzles like the hierarchy problem
- It is reasonable to expect that the dynamics underlying the Higgs phenomenon sits nearby the EW scale, justifying the yet unfulfilled hope that new physics should be seen by LHC...
- .. thus many theoretical ideas are emerging, postponing to much higher energies or to alternative scenarios the framework to understand the origin of the weak scale
- The detailed experimental investigation of Higgs properties remains nevertheless a sine qua non condition to make progress no matter what is our bias

Key question for the future developments of HEP: Why don't we see the new physics we expected to be present around the TeV scale?

Key question for the future developments of HEP: Why don't we see the new physics we expected to be present around the TeV scale?

- Is the mass scale beyond the LHC reach?
- Is the mass scale within LHC's reach, but final states are elusive to the direct search?

Key question for the future developments of HEP: Why don't we see the new physics we expected to be present around the TeV scale?

- Is the mass scale beyond the LHC reach?
- Is the mass scale within LHC's reach, but final states are elusive to the direct search?

These two scenarios are a priori equally likely, but they impact in different ways the future of HEP, and thus the assessment of the physics potential of possible future facilities

Readiness to address both scenarios is the best hedge for the field:

- precision ⇒ higher statistics, better detectors and experimental conditions
- sensitivity (to elusive signatures) ⇒ ditto
- extended energy/mass reach ⇒ higher energy

Remark

the discussion of the **future** in HEP must start from the understanding that there is no experiment/facility, proposed or conceivable, in the lab or in space, accelerator or non-accelerator driven, which can **guarantee discoveries** beyond the SM, and **answers** to the big questions of the field

- (1) the guaranteed deliverables:
 - knowledge that will be acquired independently of possible discoveries (the value of "measurements")

(1) the guaranteed deliverables:

 knowledge that will be acquired independently of possible discoveries (the value of "measurements")

(2) the **exploration potential:**

- target broad and well justified BSM scenarios but guarantee sensitivity to more exotic options
- exploit both direct (large Q2) and indirect (precision) probes

(1) the guaranteed deliverables:

 knowledge that will be acquired independently of possible discoveries (the value of "measurements")

(2) the **exploration potential:**

- target broad and well justified BSM scenarios but guarantee sensitivity to more exotic options
- exploit both direct (large Q2) and indirect (precision) probes
- (3) the potential to provide conclusive **yes/no answers** to relevant, broad questions.

The value of diversity and guaranteed deliverables in collider physics

LHC scientific production

Over 3000 papers published/submitted to refereed journals by the 7 experiments (ALICE, ATLAS, CMS, LHCb, LHCf, TOTEM, MoEDAL)

Of these:

~10% on Higgs (15% if ATLAS+CMS only)

~30% on searches for new physics (35% if ATLAS+CMS only)

~60% of the papers on SM measurements (jets, EW, top, b, HIs, ...)

Not only Higgs and BSM!

Flavour physics

- $B(s) \rightarrow \mu\mu$
- D mixing and CP violation in the D system
- ullet Measurement of the γ angle, CPV phase $oldsymbol{\phi}$ s, ...
- Lepton flavour universality in charge- and neutral-current semileptonic B decays => possible anomalies?

QCD dynamics

- Countless precise measurements of hard cross sections, and improved determinations of the proton PDF
- Measurement of total, elastic, inelastic pp cross sections at different energies, new inputs for the understanding of the dominant reactions in pp collisions
- Exotic spectroscopy: discovery and study of new tetra- and penta-quarks, doubly heavy baryons, expected sensitivity to glueballs
- Discovery of QGP-like collective phenomena (long-range correlations, strange and charm enhancement, ...) in "small" systems (pA and pp)

EW param's and dynamics

- m_W , m_{top} , $sin^2 \theta_W$
- EW interactions at the TeV scale (DY, VV, VVV, VBS, VBF, Higgs, ...)

Remarks

- These 3000 papers reflect the underlying existence, at the LHC, of 100's of scientifically "independent" experiments, which historically would have required different detectors and facilities, built and operated by different communities
- On each of these topics the LHC expts are advancing the knowledge previously acquired by dedicated facilities
 - HERA→PDFs, B-factories→flavour, RHIC→HIs, LEP/SLC→EWPT, etc
- Even in the perspective of new dedicated facilities, eg SuperKEKB or EIC,
 LHC maintains a key role of competition and complementarity

Remarks

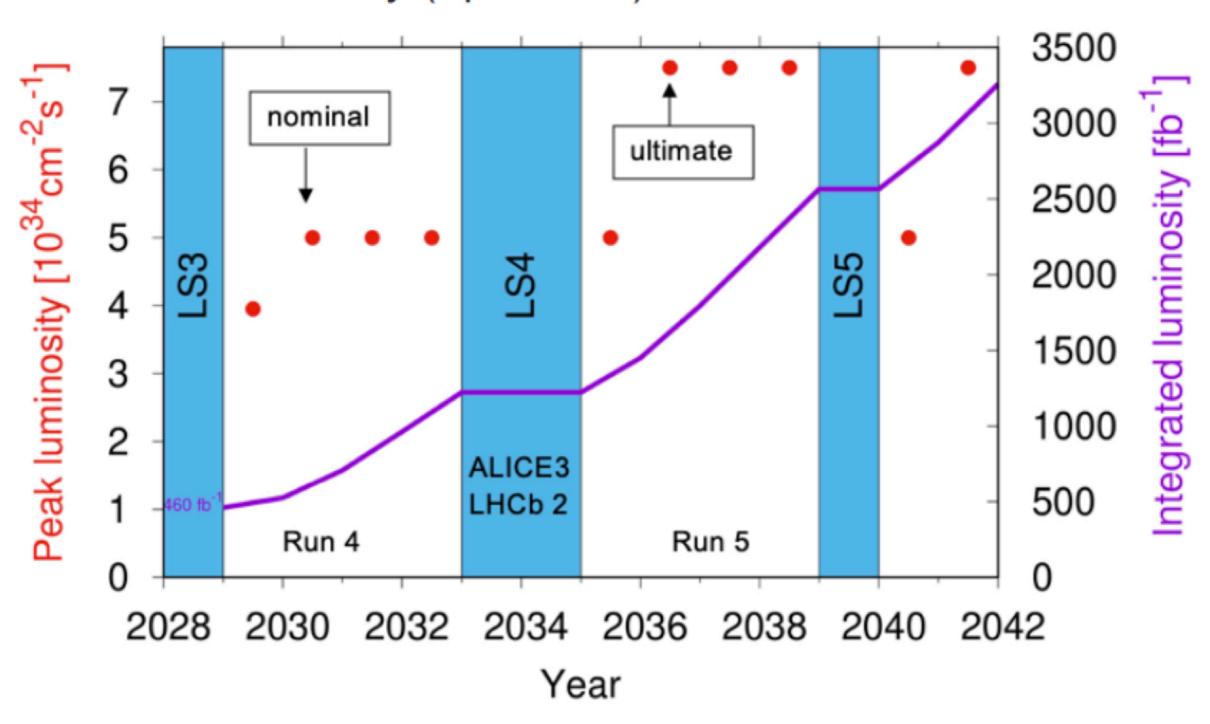

- These 3000 papers reflect the underlying existence, at the LHC, of 100's of scientifically "independent" experiments, which historically would have required different detectors and facilities, built and operated by different communities
- On each of these topics the LHC expts are advancing the knowledge previously acquired by dedicated facilities
 - HERA→PDFs, B-factories→flavour, RHIC→HIs, LEP/SLC→EWPT, etc
- Even in the perspective of new dedicated facilities, eg SuperKEKB or EIC,
 LHC maintains a key role of competition and complementarity

I have a broad concept of "new physics", which includes SM phenomena, emerging from the data, that are unexpected, surprising, or simply poorly understood.

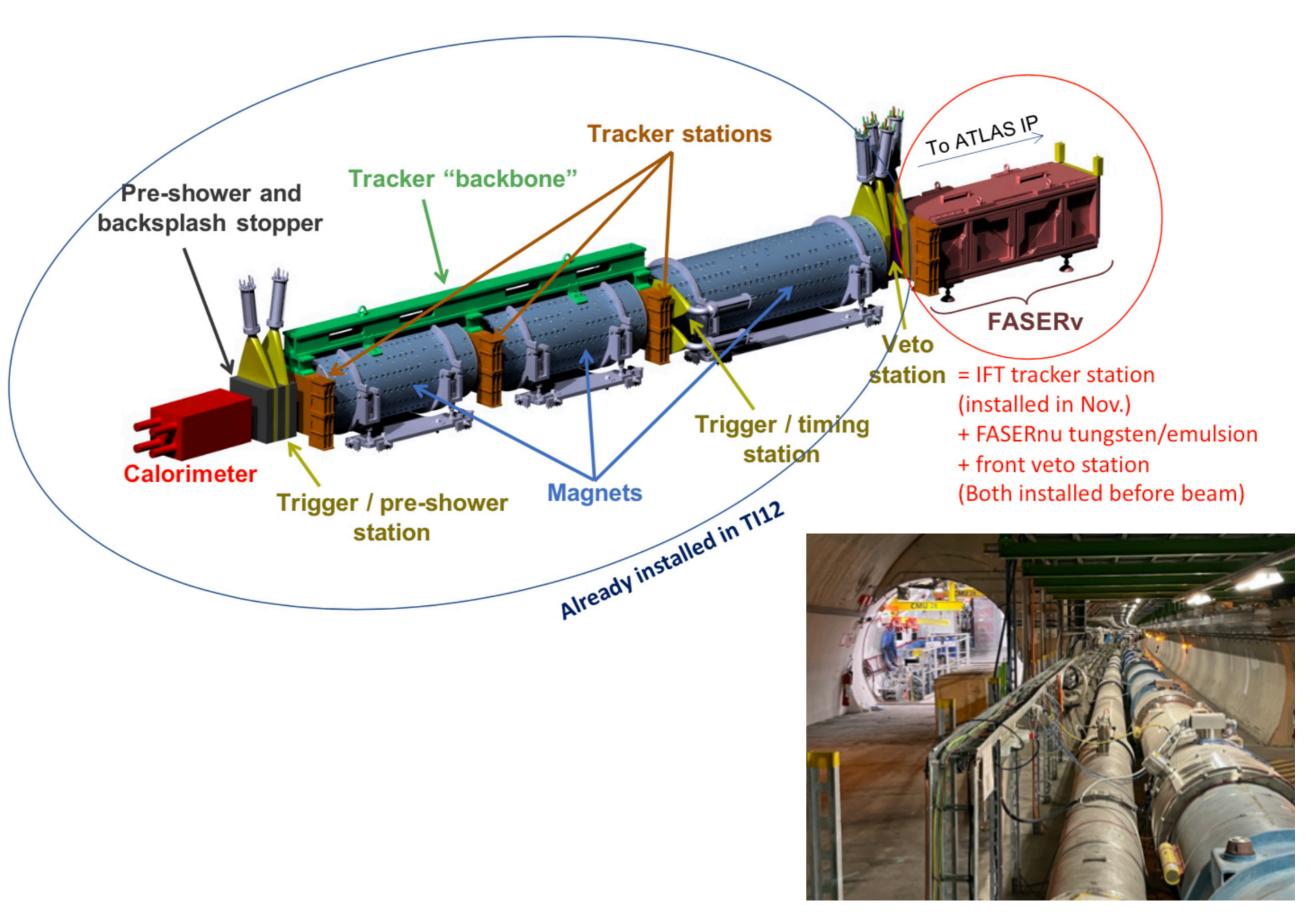

I consider as "new", and as a discovery, everything that is not obviously predictable, or that requires deeper study to be clarified, even if it belongs to the realm of SM phenomena.

"New physics" is emerging every day at the LHC!

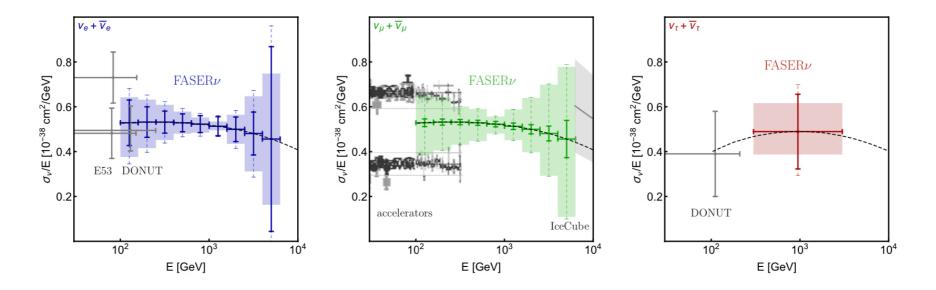

Preliminary (optimistic) schedule of HL-LHC

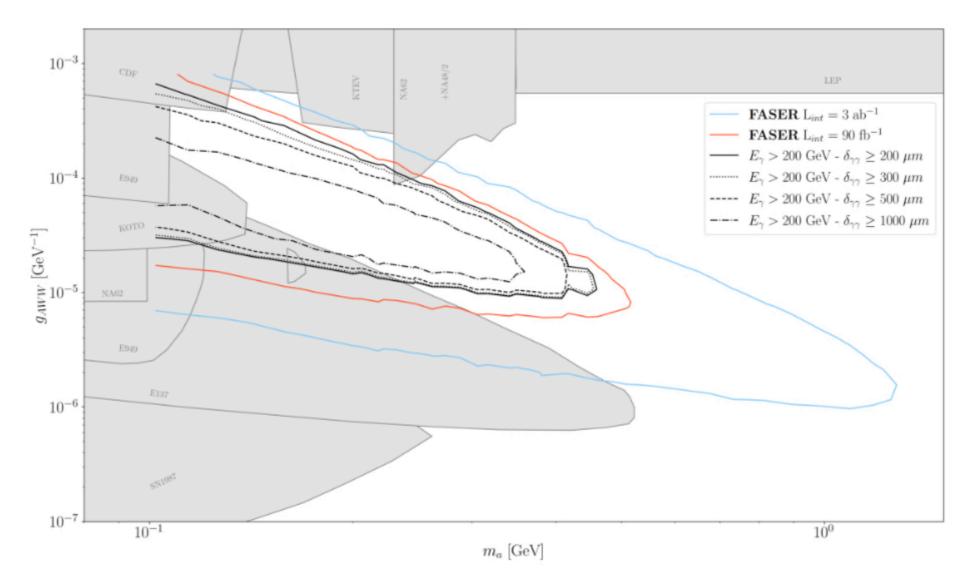

FASER

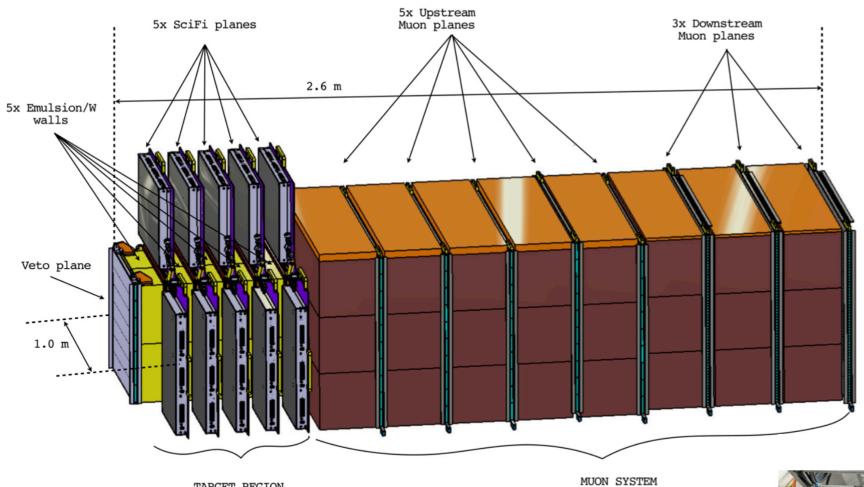

Guaranteed deliverables: neutrino cross sections

Exploration power: LLPs, ALPs→γγ, ...

Beyond the LHC

Future Circular Collider

- Guaranteed deliverables:
 - study of Higgs and top quark properties, and exploration of EWSB phenomena, with the best possible precision and sensitivity

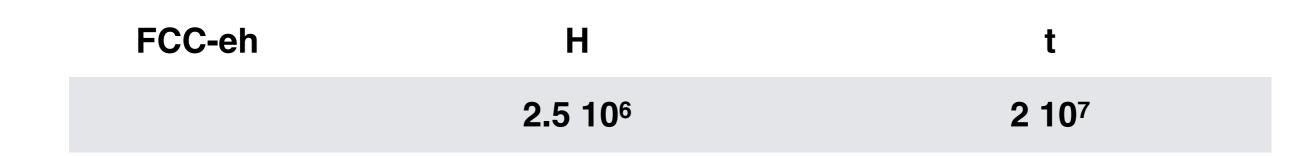

- Guaranteed deliverables:
 - study of Higgs and top quark properties, and exploration of EWSB phenomena, with the best possible precision and sensitivity
- Exploration potential:
 - exploit both direct (large Q²) and indirect (precision) probes
 - enhanced mass reach for direct exploration at 100 TeV
 - E.g. match the mass scales for new physics that could be exposed via indirect precision measurements in the EW and Higgs sector

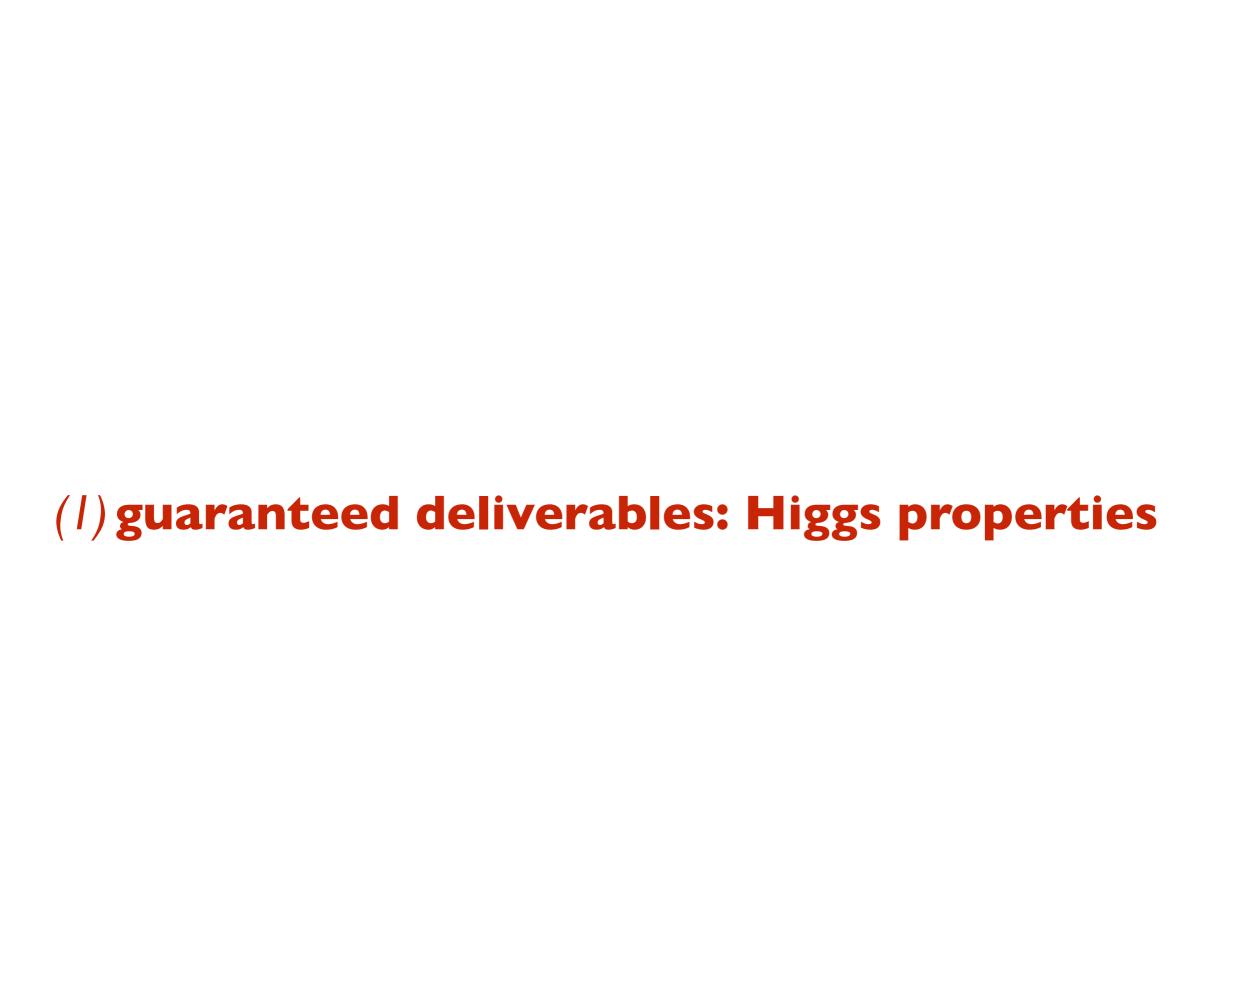

- Guaranteed deliverables:
 - study of Higgs and top quark properties, and exploration of EWSB phenomena, with the best possible precision and sensitivity
- Exploration potential:
 - exploit both direct (large Q2) and indirect (precision) probes
 - enhanced mass reach for direct exploration at 100 TeV
 - E.g. match the mass scales for new physics that could be exposed via indirect precision measurements in the EW and Higgs sector
- Provide firm Yes/No answers to questions like:
 - is there a TeV-scale solution to the hierarchy problem?
 - is DM a thermal WIMP?
 - could the cosmological EW phase transition have been 1st order?
 - could baryogenesis have taken place during the EW phase transition?
 - could neutrino masses have their origin at the TeV scale?
 - ...

	Model	$b\overline{b}$	$c\overline{c}$	gg	WW	au au	ZZ	$\gamma\gamma$	$\mu\mu$
1	MSSM [40]	+4.8	-0.8	- 0.8	-0.2	+0.4	-0.5	+0.1	+0.3
2	Type II 2HD [42]	+10.1	-0.2	-0.2	0.0	+9.8	0.0	+0.1	+9.8
3	Type X 2HD [42]	-0.2	-0.2	-0.2	0.0	+7.8	0.0	0.0	+7.8
4	Type Y 2HD [42]	+10.1	-0.2	-0.2	0.0	-0.2	0.0	0.1	-0.2
5	Composite Higgs [44]	-6.4	-6.4	-6.4	-2.1	-6.4	-2.1	-2.1	-6.4
6	Little Higgs w. T-parity [45]	0.0	0.0	-6.1	-2.5	0.0	-2.5	-1.5	0.0
7	Little Higgs w. T-parity [46]	-7.8	-4.6	-3.5	-1.5	-7.8	-1.5	-1.0	-7.8
8	Higgs-Radion [47]	-1.5	- 1.5	+10.	-1.5	-1.5	-1.5	-1.0	-1.5
9	Higgs Singlet [48]	-3.5	-3.5	-3.5	-3.5	-3.5	-3.5	-3.5	-3.5

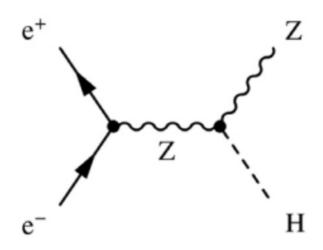

NB: when the b coupling is modified, BR deviations are smaller than the square of the coupling deviation. Eg in model 5, the BR to b, c, tau, mu are practically SM-like

(sub)-% precision must be the goal to ensure 3-5σ evidence of deviations, and to cross-correlate coupling deviations across different channels

The absolutely unique power of $e^+e^- \rightarrow ZH$ (circular or linear):

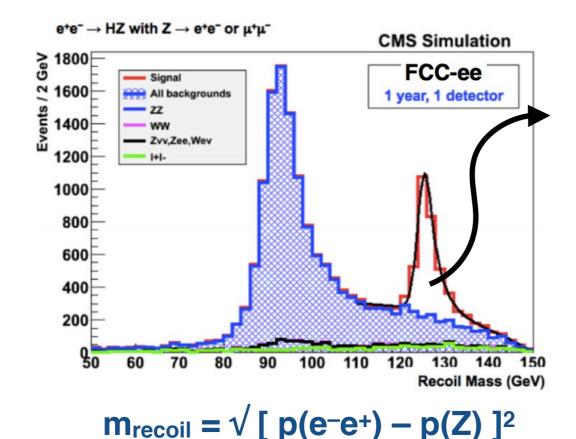

- the model independent absolute measurement of HZZ coupling, which allows the subsequent:
 - sub-% measurement of couplings to W, Z, b, T
 - % measurement of couplings to gluon and charm

$$p(H) = p(e^-e^+) - p(Z)$$

=> [$p(e^-e^+) - p(Z)$]² peaks at m²(H)

reconstruct Higgs events independently of the Higgs decay mode!

$$N(ZH) \propto \sigma(ZH) \propto g_{HZZ}^2$$

$$N(ZH[\rightarrow ZZ]) \propto$$
 $\sigma(ZH) \times BR(H \rightarrow ZZ) \propto$
 $g_{HZZ}^2 \times g_{HZZ}^2 / \Gamma(H)$

=> absolute measurement of width and couplings

The absolutely unique power of pp \rightarrow H+X:

- the extraordinary statistics that, complemented by the per-mille e⁺e⁻ measurement of eg BR($H \rightarrow ZZ^*$), allows
 - the sub-% measurement of rarer decay modes
 - the ~5% measurement of the Higgs trilinear selfcoupling
- the huge dynamic range (eg pt(H) up to several TeV), which allows to
 - probe d>4 EFT operators up to scales of several TeV
 - search for multi-TeV resonances decaying to H, or extensions of the Higgs sector

@100 TeV

s-channel resonances

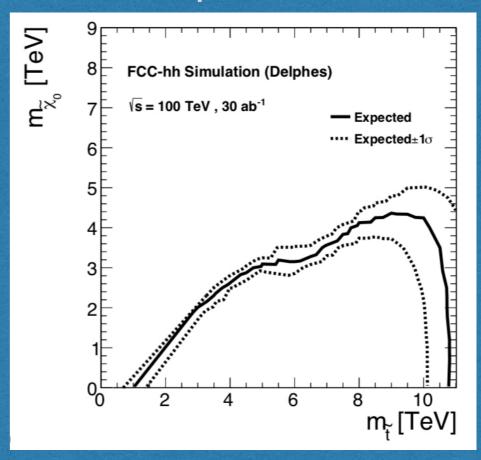

SUSY reach at 100 TeV

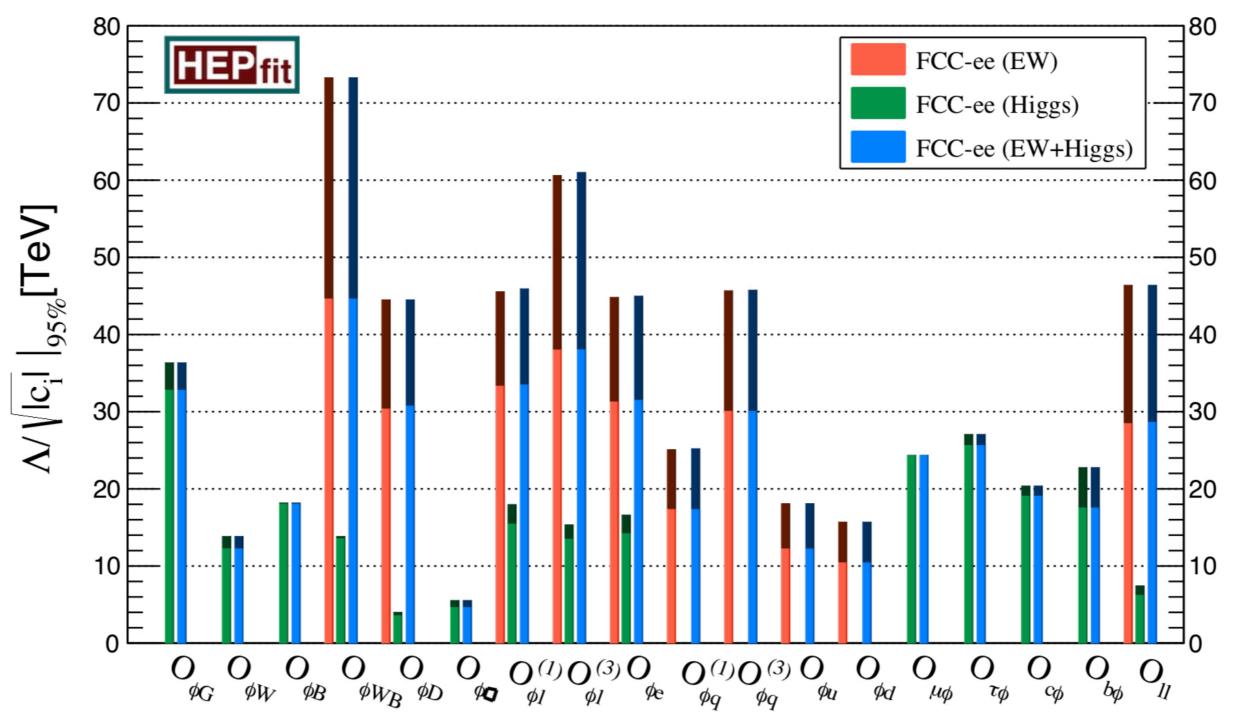

Early phenomenology studies

New detector performance studies

Global EFT fits to EW and H observables at FCC-ee

Constraints on the coefficients of various EFT op's from a global fit of (i) EW observables, (ii) Higgs couplings and (iii) EW+Higgs combined. Darker shades of each color indicate the results neglecting all SM theory uncertainties.

100 TeV is the appropriate CoM energy to directly search for new physics appearing indirectly through precision EW and H measurements at the future ee collider

(3) The potential for yes/no answers to important questions

WIMP DM theoretical constraints

For particles held in equilibrium by pair creation and annihilation processes, ($\chi \chi \leftrightarrow SM$)

$$\Omega_{\mathrm{DM}} h^2 \sim \frac{10^9 \mathrm{GeV}^{-1}}{M_{\mathrm{pl}}} \frac{1}{\langle \sigma v \rangle}$$

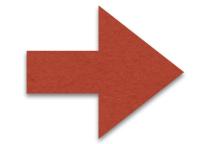

For a particle annihilating through processes which do not involve any larger mass scales:

$$\langle \sigma v \rangle \sim g_{\rm eff}^4/M_{\rm DM}^2$$

$$\Omega_{\rm DM} h^2 \sim 0.12 \times \left(\frac{M_{\rm DM}}{2 \, {\rm TeV}}\right)^2 \left(\frac{0.3}{g_{\rm eff}}\right)^4$$

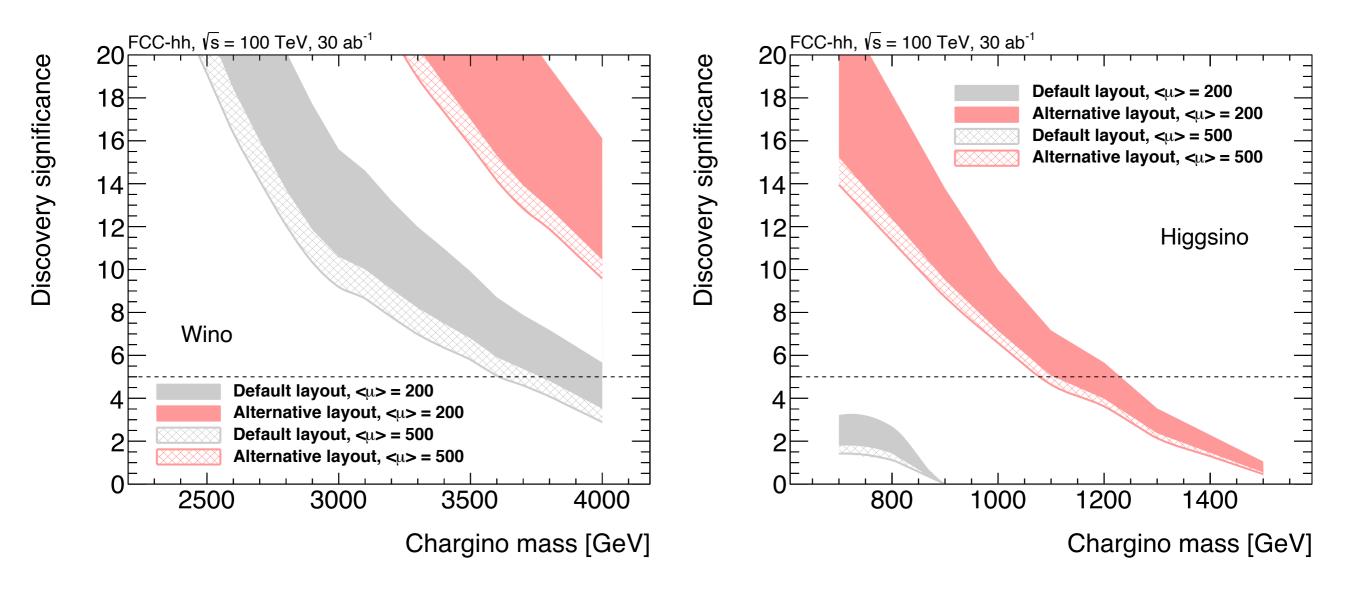

$$\Omega_{wimp} h^2 \lesssim 0.12$$

$$M_{wimp} \lesssim 2 \text{ TeV} \left(\frac{g}{0.3}\right)^2$$

New detector performance studies

Disappearing charged track analyses (at ~full pileup)

=> coverage beyond the upper limit of the thermal WIMP mass range for both higgsinos and winos !!

$$M_{wimp} \lesssim 2 \text{ TeV} \left(\frac{g}{0.3}\right)^2$$

... and much more ...

- Countless studies of discovery potential for multiple BSM scenarios, from SUSY to heavy neutrinos, from very low masses to very high masses, LLPs, DM, etcetcetc, at FCC-ee, FCC-hh and FCC-eh
- Sensitivity studies to SM deviations in the properties of top quarks, flavour physics in Z decays: huge event rates offer unique opportunities, that cannot be matched elsewhere
- •
- Operations with heavy ions: new domains open up at 100 TeV in the study of high-T/high-density QCD. Broaden the targets, the deliverables, extend the base of potential users, and increase the support beyond the energy frontier community

Final remarks

- The study of the SM will not be complete until we clarify the nature of the Higgs mechanism and exhaust the exploration of phenomena at the TeV scale: many aspects are still obscure, many questions are still open.
- The exptl program possible at a future collider facility, combining a versatile high-luminosity e+e- circular collider, with a follow-up pp collider in the 100 TeV range, offers unmatchable breadth and diversity: concrete, compelling and indispensable Higgs & SM measurements enrich a unique direct & indirect discovery potential
- The technological, financial and sociological challenges are immense, and will test our community ability to build and improve on the experience of similar challenges in the past.
- The next 5-6 years, before the next review of the European Strategy for Particle Physics, will be critical to reach the scientific consensus and political support required to move forward
