Study of HH production at the High-Luminosity LHC with CMS

Friday, 8 July 2022 20:10 (20 minutes)

The High-Luminosity Large Hadron Collider (HL-LHC) is expected to deliver an integrated luminosity of up to 3000 fb-1 at sqrt{s} = 14 TeV. The very high instantaneous luminosity will lead to about 200 proton-proton collisions per bunch crossing ("pileup") superimposed to each event of interest, therefore providing extremely challenging experimental conditions. CMS prospects on study of the HH production at the HL-LHC are presented.

In-person participation

Yes
