QED nuclear medium effects in neutrino-nucleus and electron-nucleus scattering

Friday, 8 July 2022 16:00 (15 minutes)

Effective field theories of QCD, such as soft collinear effective theory with Glauber gluons, have led to important advances in understanding of many-body nuclear effects. We provide first applications to QED processes. We study the exchange of photons between charged particles and the nuclear medium for (anti)neutrino-, electron-, and muon-induced reactions inside a large nucleus. We provide analytical expressions for the distortion of (anti)neutrino-nucleus and charged lepton-nucleus cross sections and estimate the QED-medium effects on the example of elastic lepton-nucleon reactions in kinematics of modern and future experiments. We find new percent-level effects, which were never accounted for in either (anti)neutrino-nucleus or electron-nucleus scattering. We discuss implications to the extraction of the proton charge radius.

In-person participation

Yes

Primary authors: Dr VITEV, Ivan (Los Alamos National Laboratory); TOMALAK, Oleksandr (Los Alamos National Laboratory)

Presenter: TOMALAK, Oleksandr (Los Alamos National Laboratory)

Session Classification: Neutrino Physics
