

# Searches for Extended Higgs Sectors at CMS

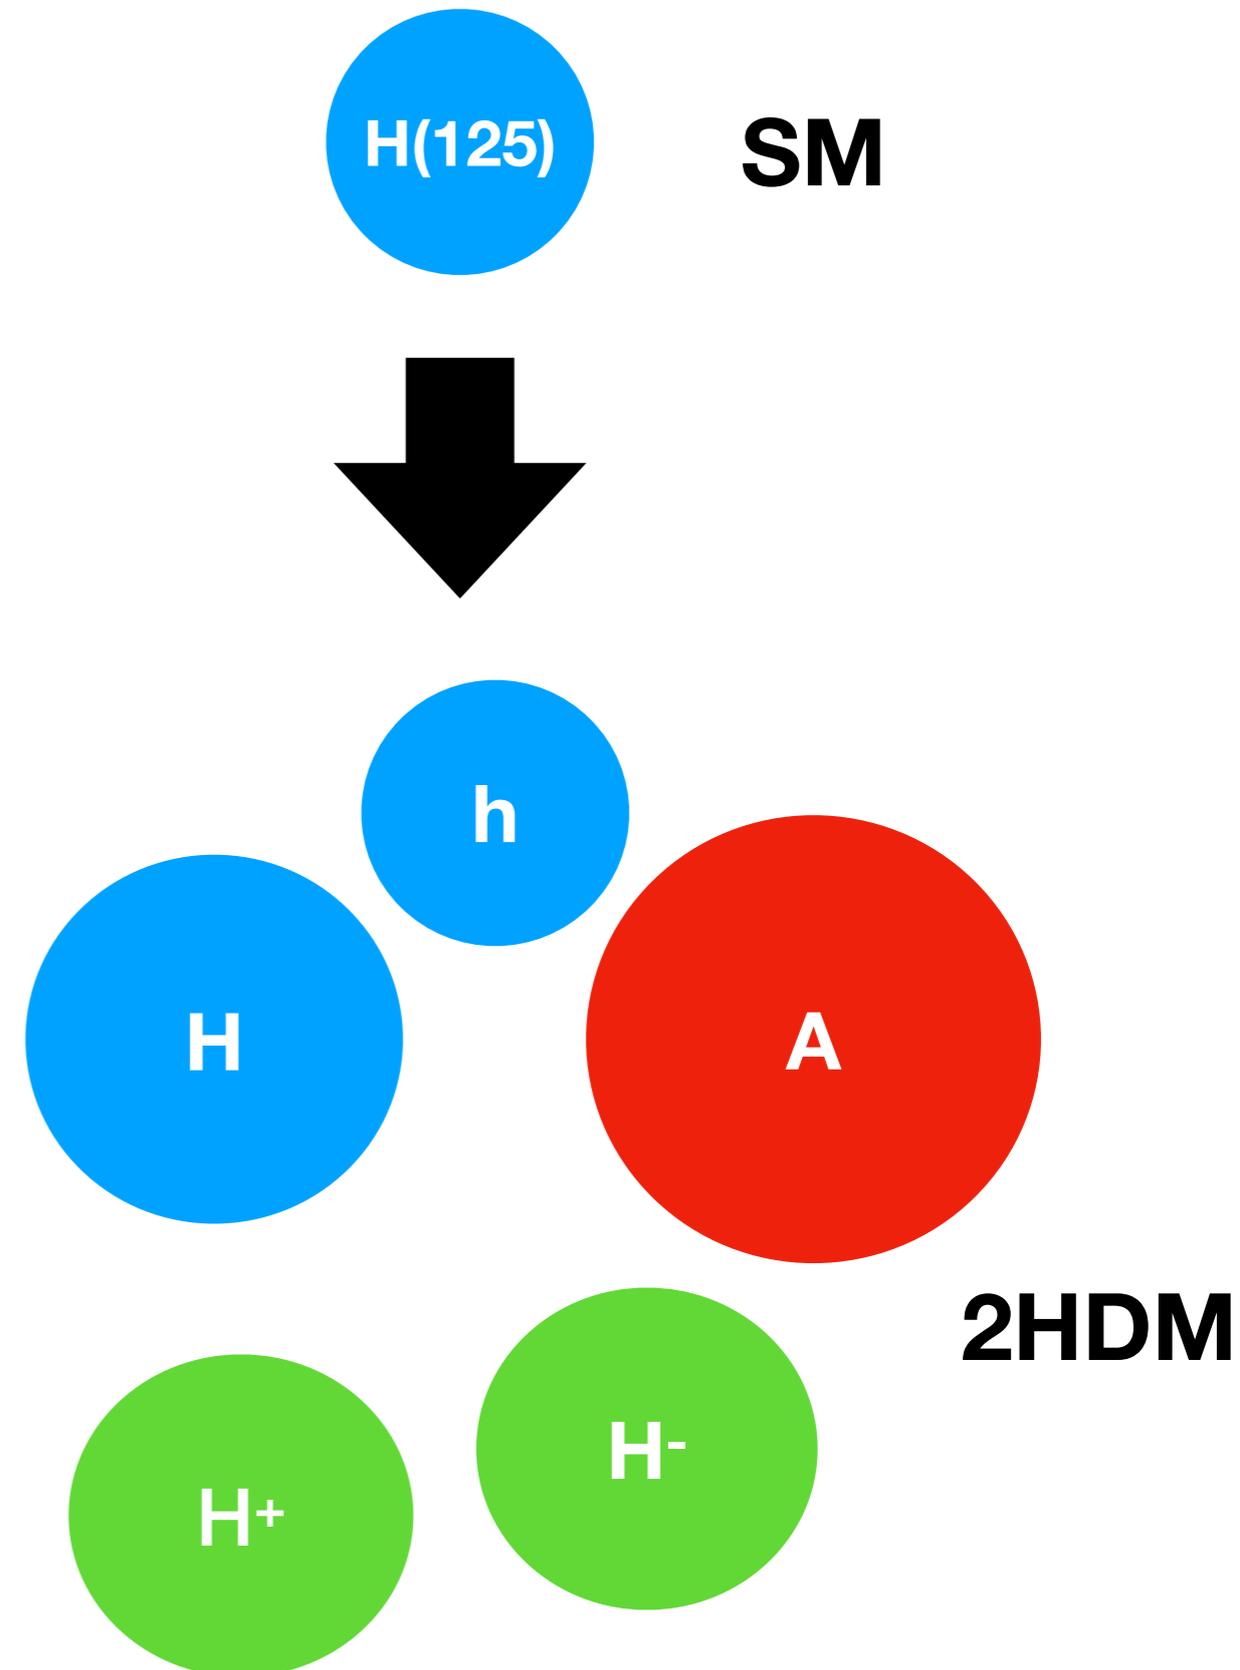

Daniel Winterbottom on behalf of the CMS Collaboration  
ICHEP2022 conference  
[d.winterbottom15@imperial.ac.uk](mailto:d.winterbottom15@imperial.ac.uk)

# Introduction

- Today I present the latest results by the CMS Collaboration in search for additional charged and neutral Higgs bosons
- Lots of searches performed by CMS in many final states
- Will focus today on very latest results from this year
- Note I will not cover  $H(125) \rightarrow aa$  searches as these are covered in the next talk by Khawla Jaffel
- All results shown today utilise the  $138 \text{ fb}^{-1}$  13 TeV dataset collected by CMS between 2016–2018

# Motivations

- After spontaneous symmetry breaking SM Higgs sector has one DOF = SM Higgs Boson H(125)
- Extended Higgs sectors may contain additional Higgs doublets and/or singlets
- Additional degrees of freedom = additional Higgs bosons
- E.g 2 Higgs doublet model (2HDM) has 3 neutral bosons (h, H, A), and 2 charged Higgs ( $H^\pm$ )
- We can search for these additional spin-0 particles at the LHC

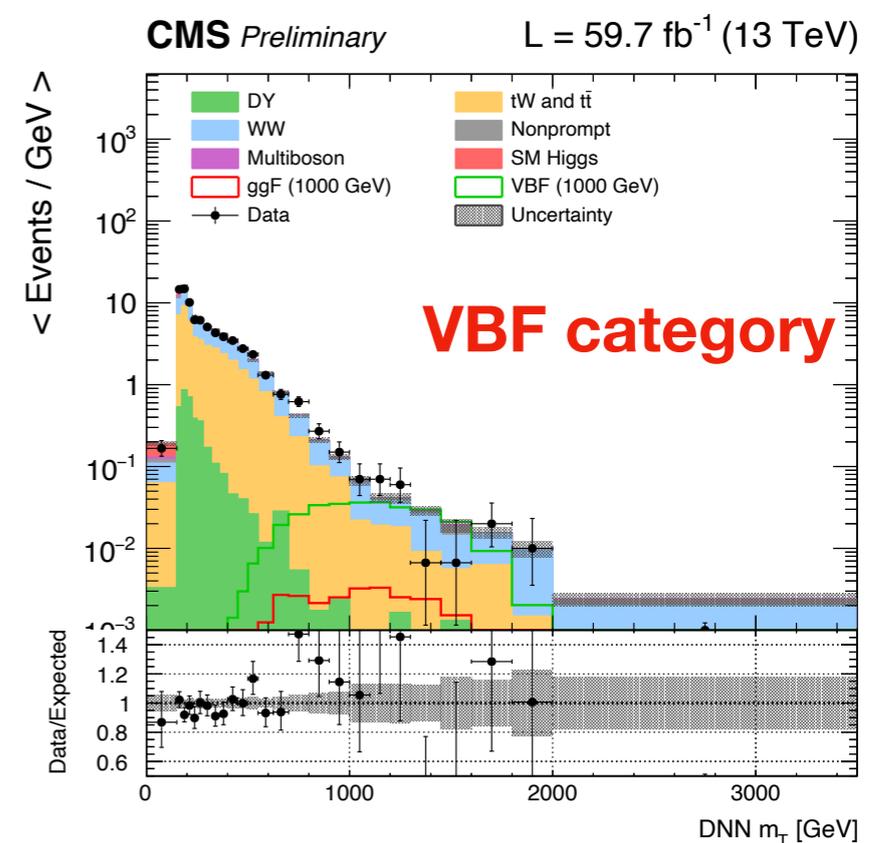

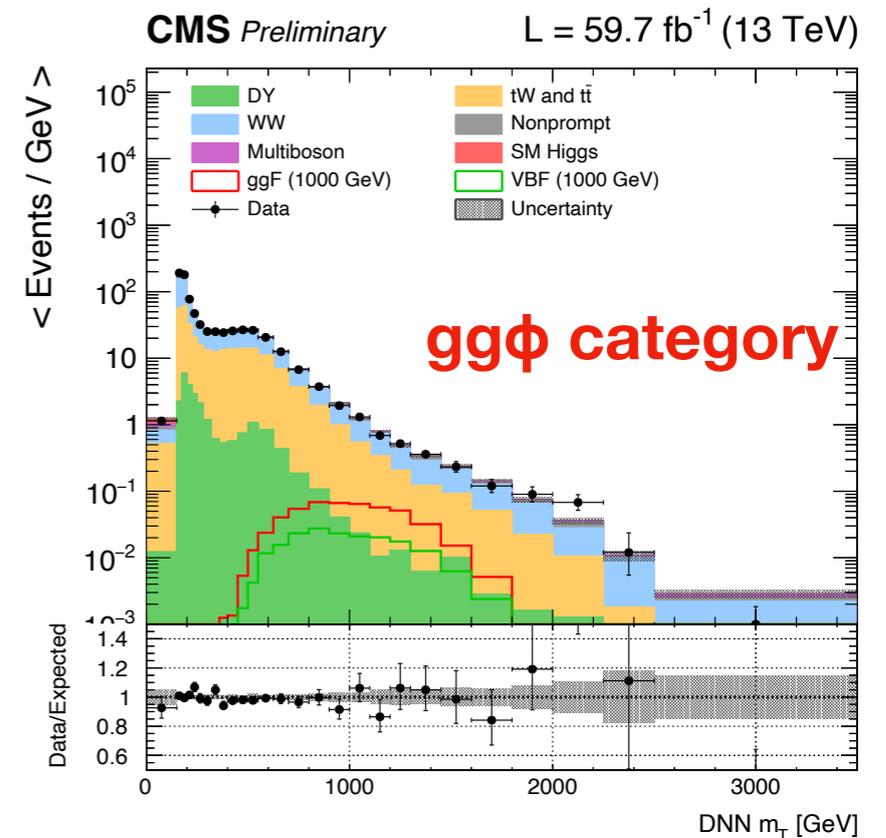

# Neutral Higgs

# H → WW

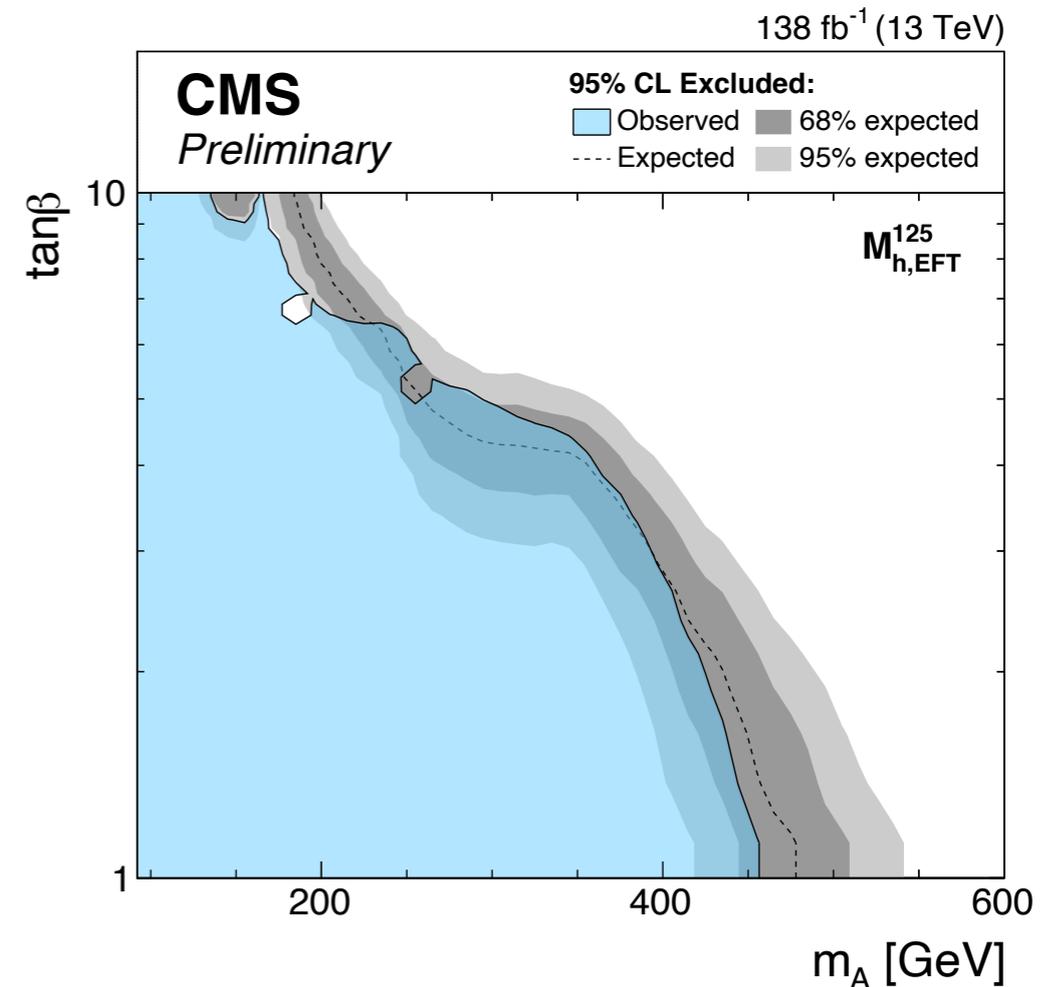

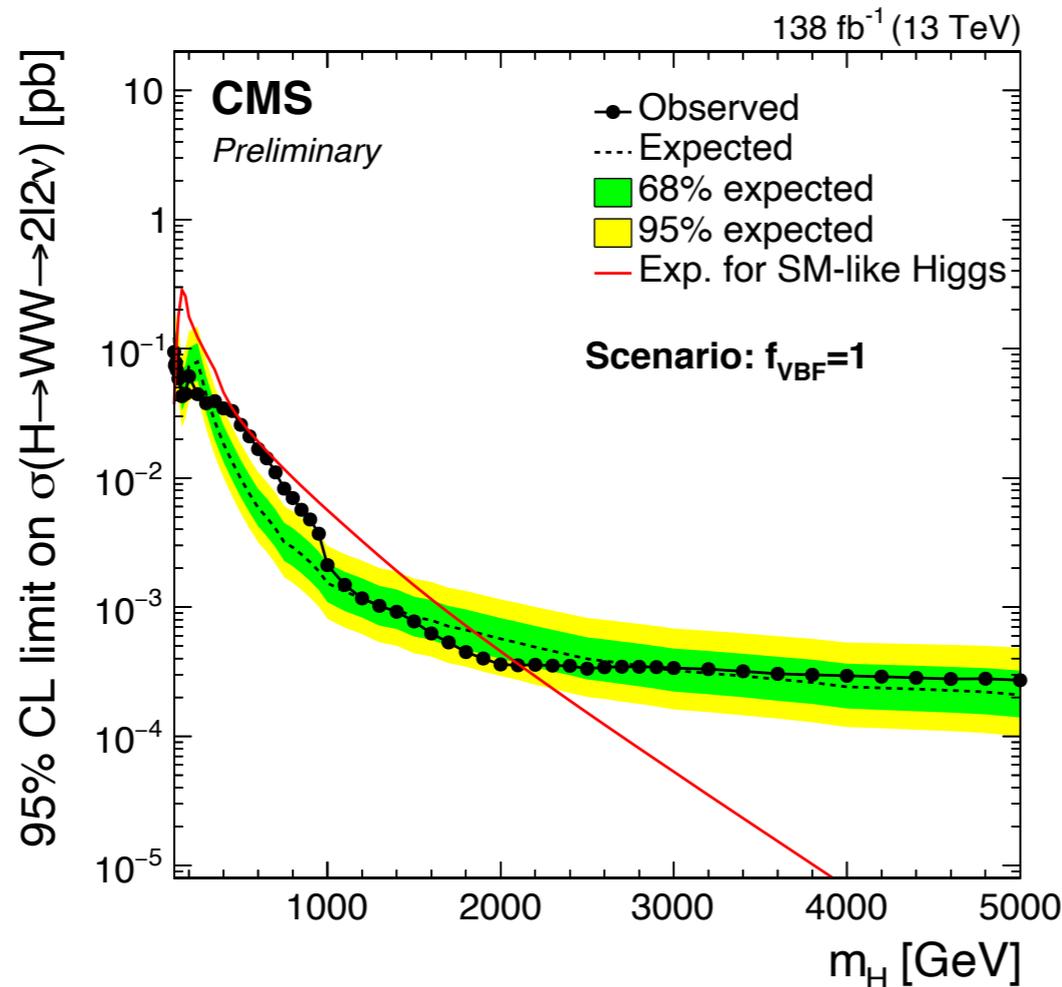

- Search for H decaying into WW in mass range 115 GeV – 5 TeV
  - Leptonic final states considered: eμ, μμ, ee
  - Production by gluon fusion (ggϕ) and VBF
- Low and high (> 1 TeV) mass search strategies
  - For high mass W's are boosted and therefore back-to-back
  - Deep neural network (DNN) separates background, ggϕ, and VBF
  - DNN regresses H mass which is fitted to extract results

[HIG-20-016](#)

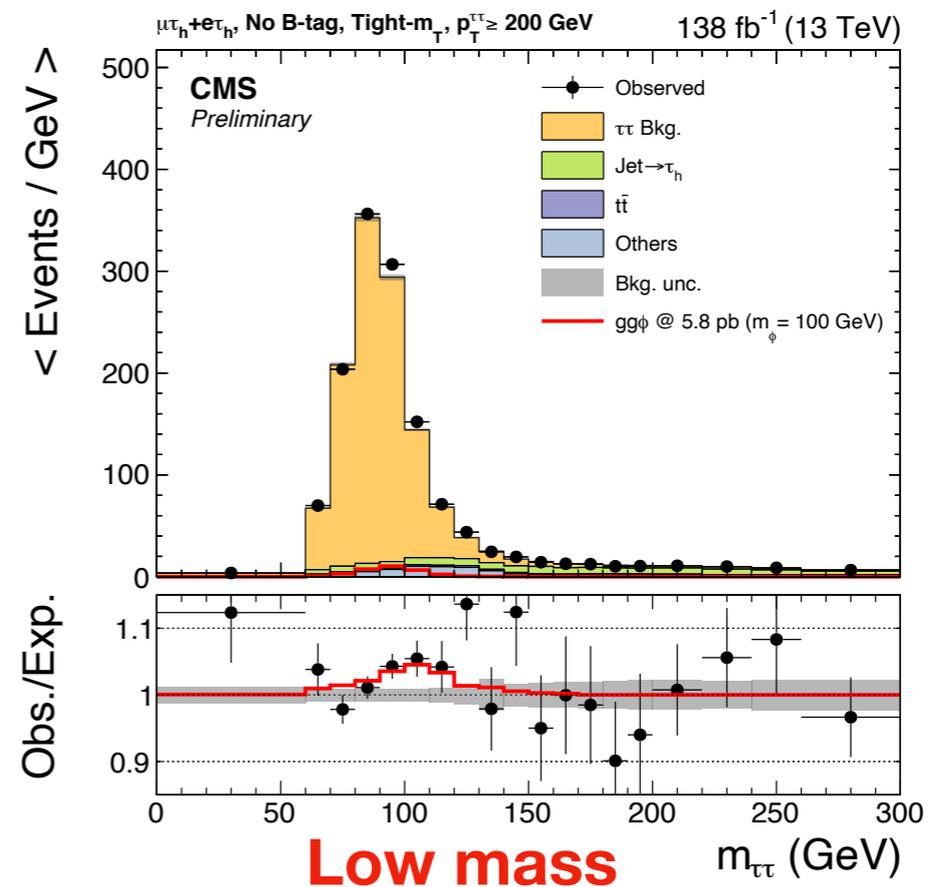

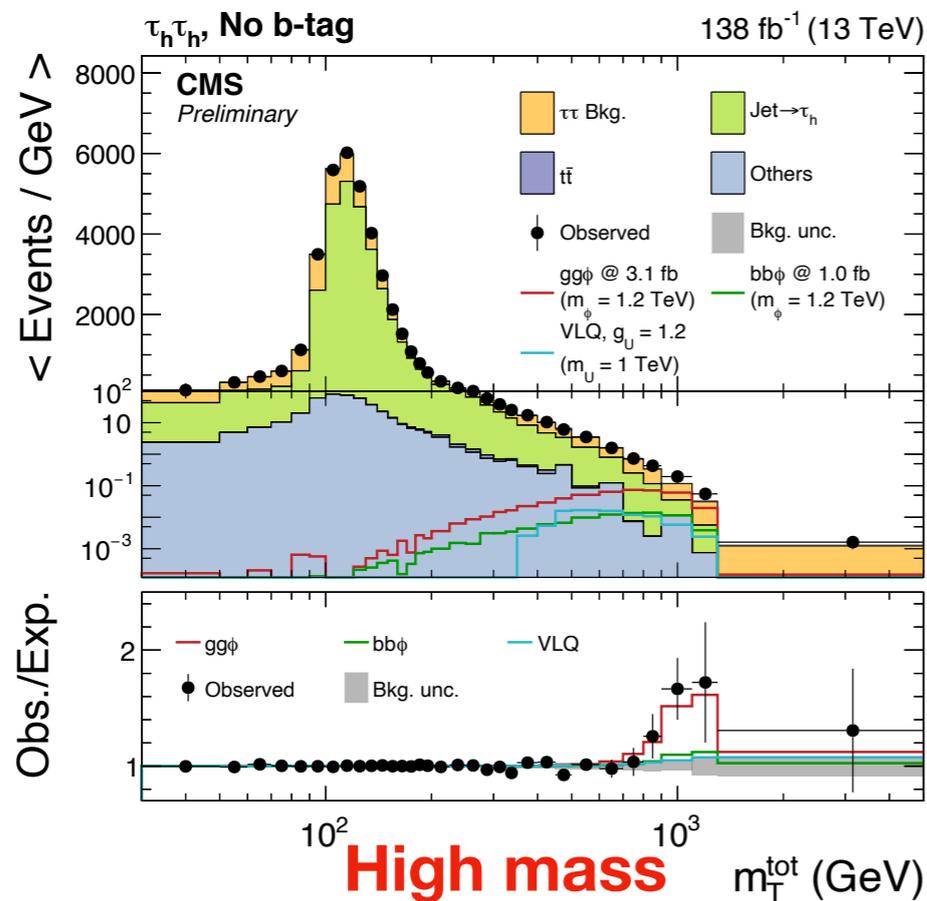

# H → WW: Results

- Several width hypotheses considered range from 0.1 – 10%
- Interference effects between background and signal accounted for via reweighing (MELA)
- Limits presented on cross-sections for different assumption for VBF fraction ( $f_{\text{VBF}}$ )
- Excess in mass region  $\sim 650\text{--}800$  GeV, largest local (global) significance for VBF [ $f_{\text{VBF}}=1$ ] @ 650 GeV → 3.8 (2.6) $\sigma$
- Largest excess for  $gg\phi$  @ 950 GeV → 2.6 (0.4) $\sigma$
- Interpretations in 2HDMs and MSSM

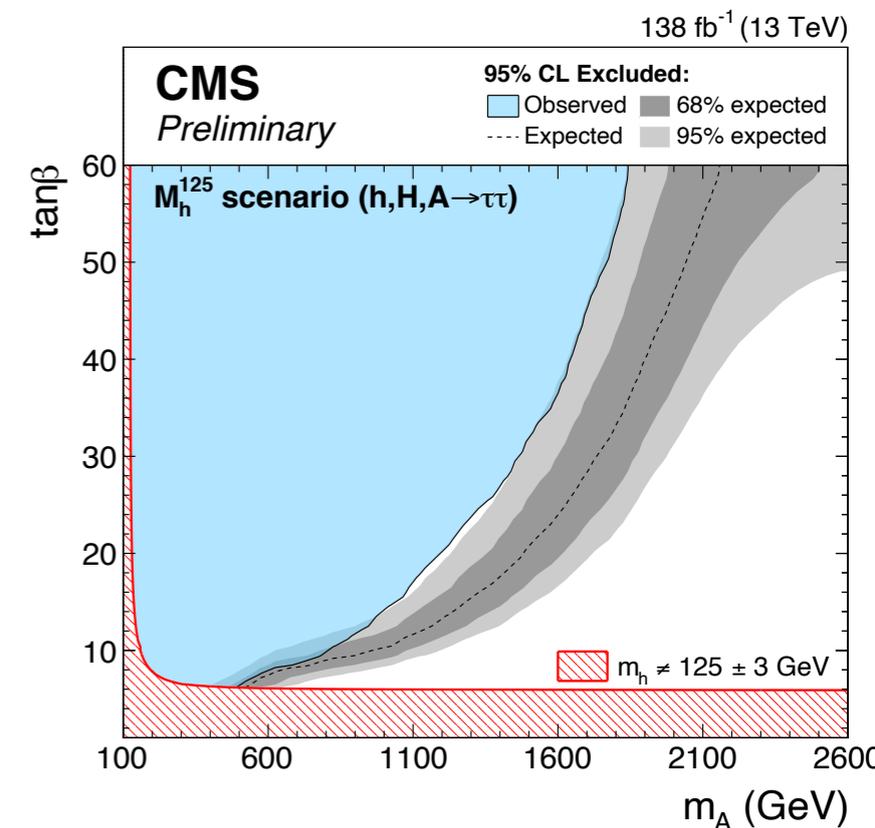

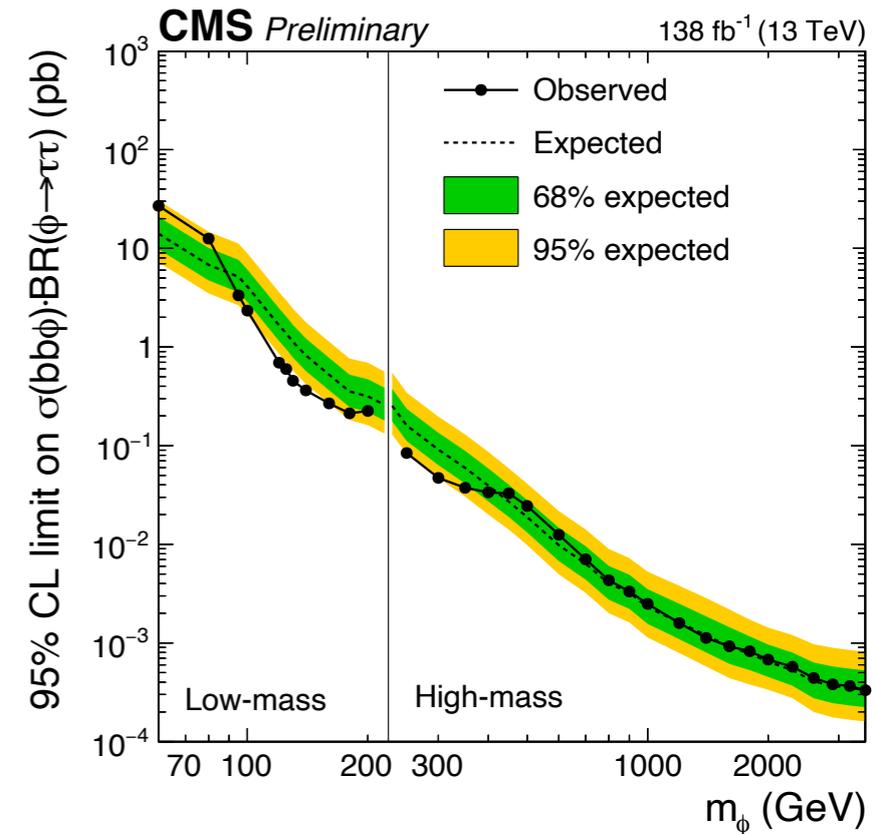

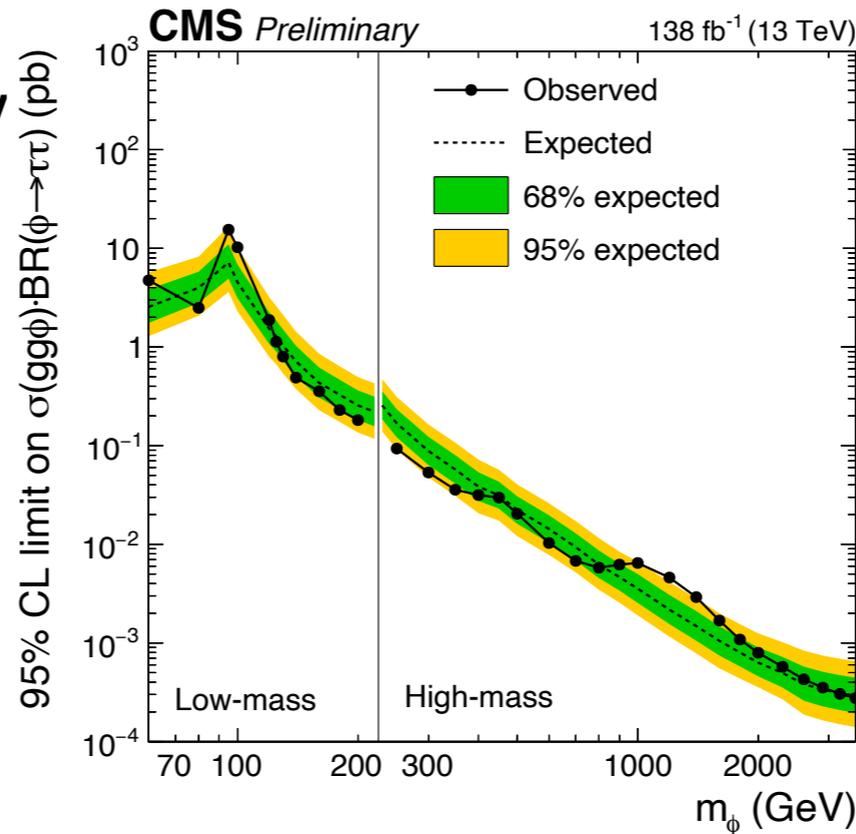

[HIG-20-016](#)

- Search for H/A production via  $gg\phi$  and b-associated production ( $bb\phi$ ) in mass range 60 GeV – 3.5 TeV
  - Target using 0 and  $>0$  b-jet categories
- 4 most sensitive  $\tau\tau$  final states:  $\tau_h\tau_h$ ,  $\mu\tau_h$ ,  $e\tau_h$ ,  $e\mu$
- Analysis split into high and low mass search regions
  - Fit total transverse mass ( $m_{T}^{\text{tot}}$ ), for high mass and di- $\tau$  mass ( $m_{\tau\tau}$ ) for low mass

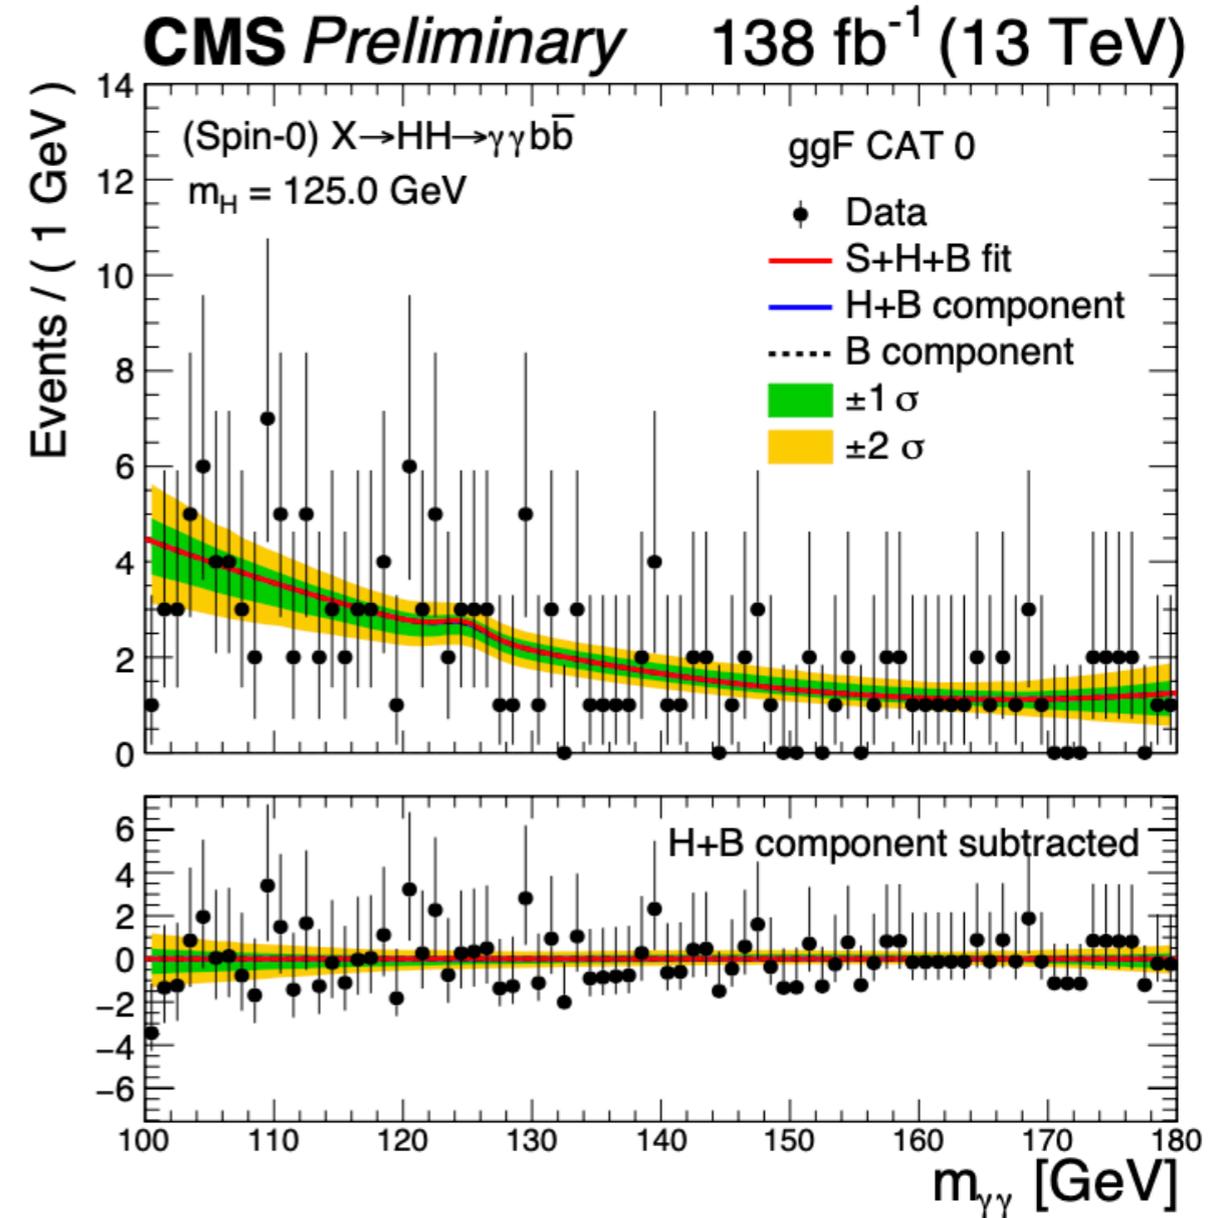

HIG-21-001

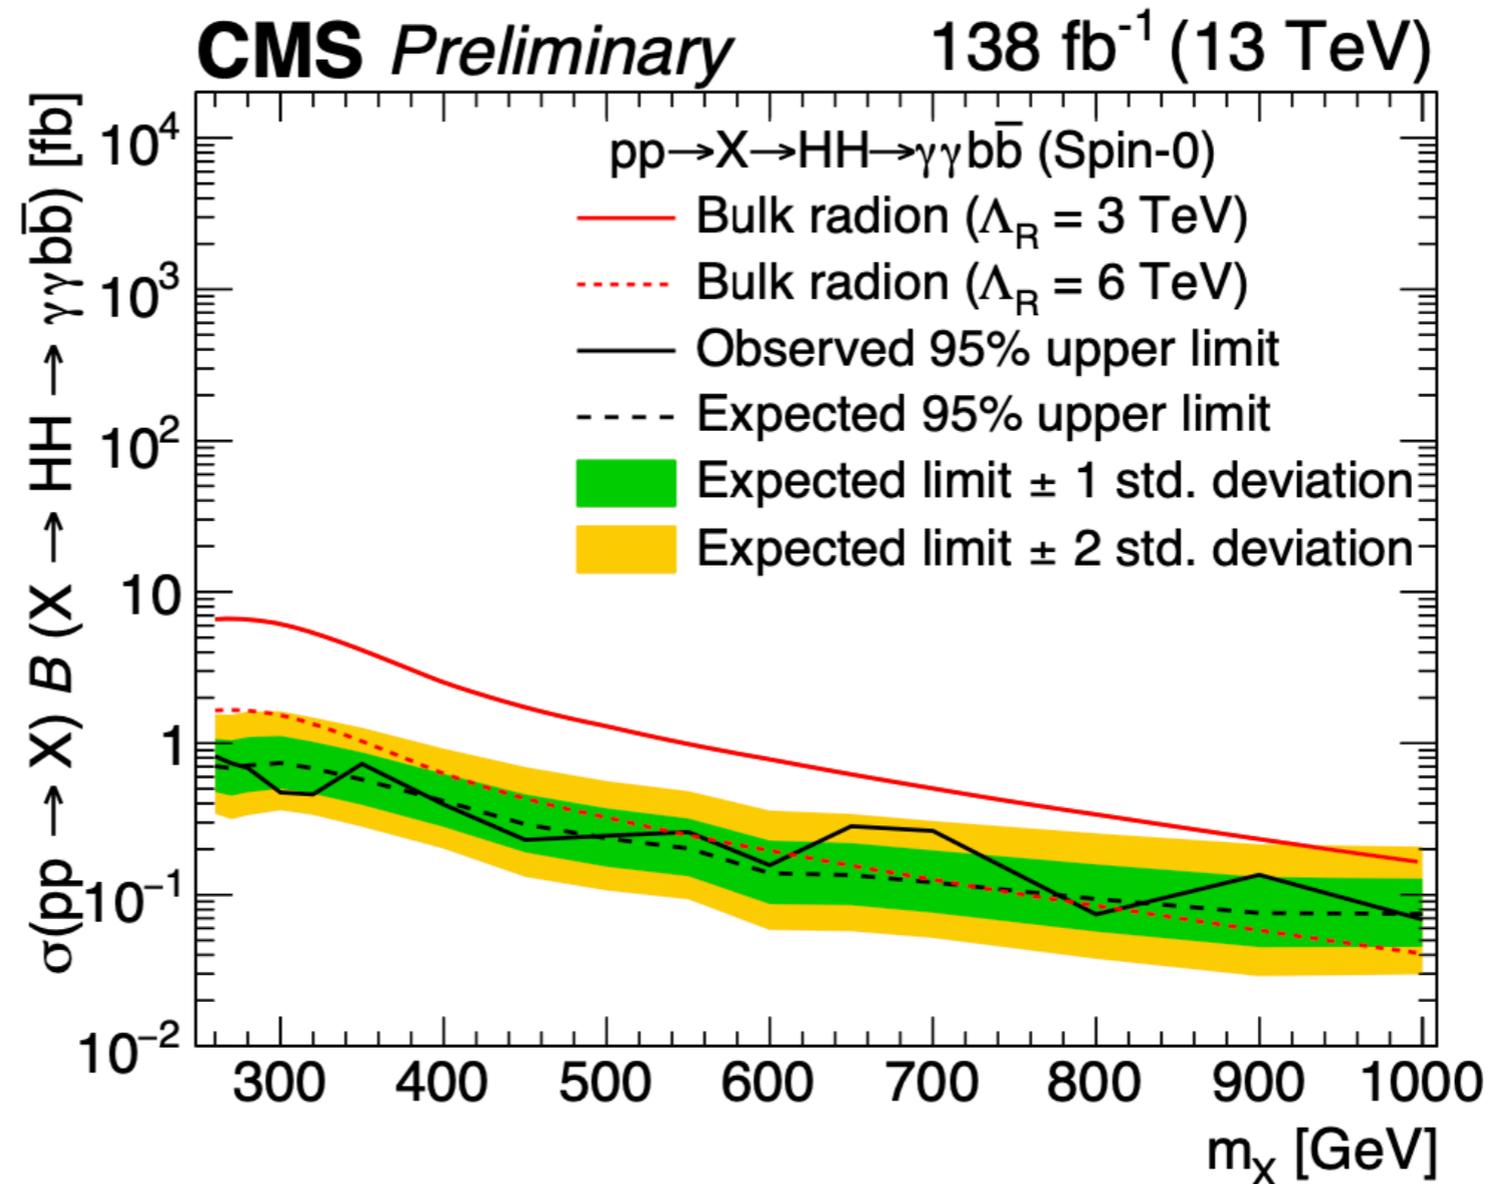

- Two excesses observed for  $gg\phi$  at 100 GeV and 1.2 TeV
  - Local (global) significance = 3.1 (2.7) $\sigma$  @ 100 GeV
  - 2.8 (2.4) $\sigma$  @ 1.2 TeV
  - Note global significance only accounts for the low (high) mass search range
- Limits set on cross-sections for  $gg\phi$  and  $bb\phi$
- Results interpreted in MSSM benchmark scenarios and vector-leptoquark models

- NN to reject ttH background
- BDT to reject non-resonant γ(γ)+ jets background
- B jets tagged using DNN (“DeepJet”)
- $\widetilde{M}_X$  variable used to select events in a window close to  $m_H$ 
  - $\widetilde{M}_X = m_{\gamma\gamma jj} - (m_{\gamma\gamma} - m_H) - (m_{jj} - m_{H,\gamma})$
- 2D fit of  $m_{\gamma\gamma}$  vs  $m_{jj}$

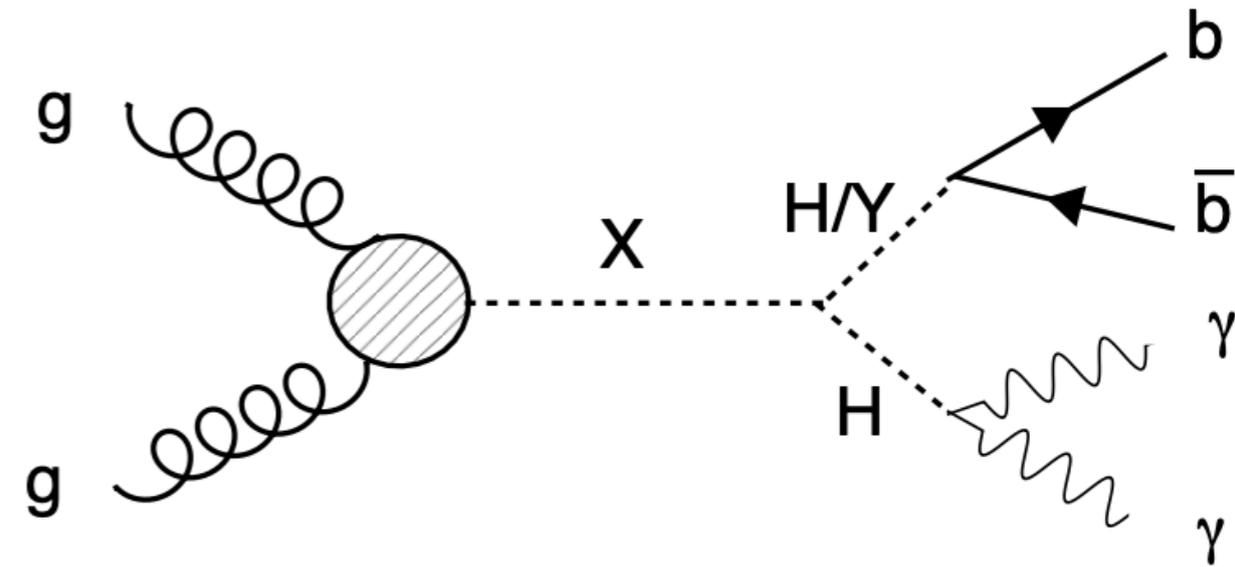

- No statistically significant excesses observed
- Limits set of cross sections times branching fractions

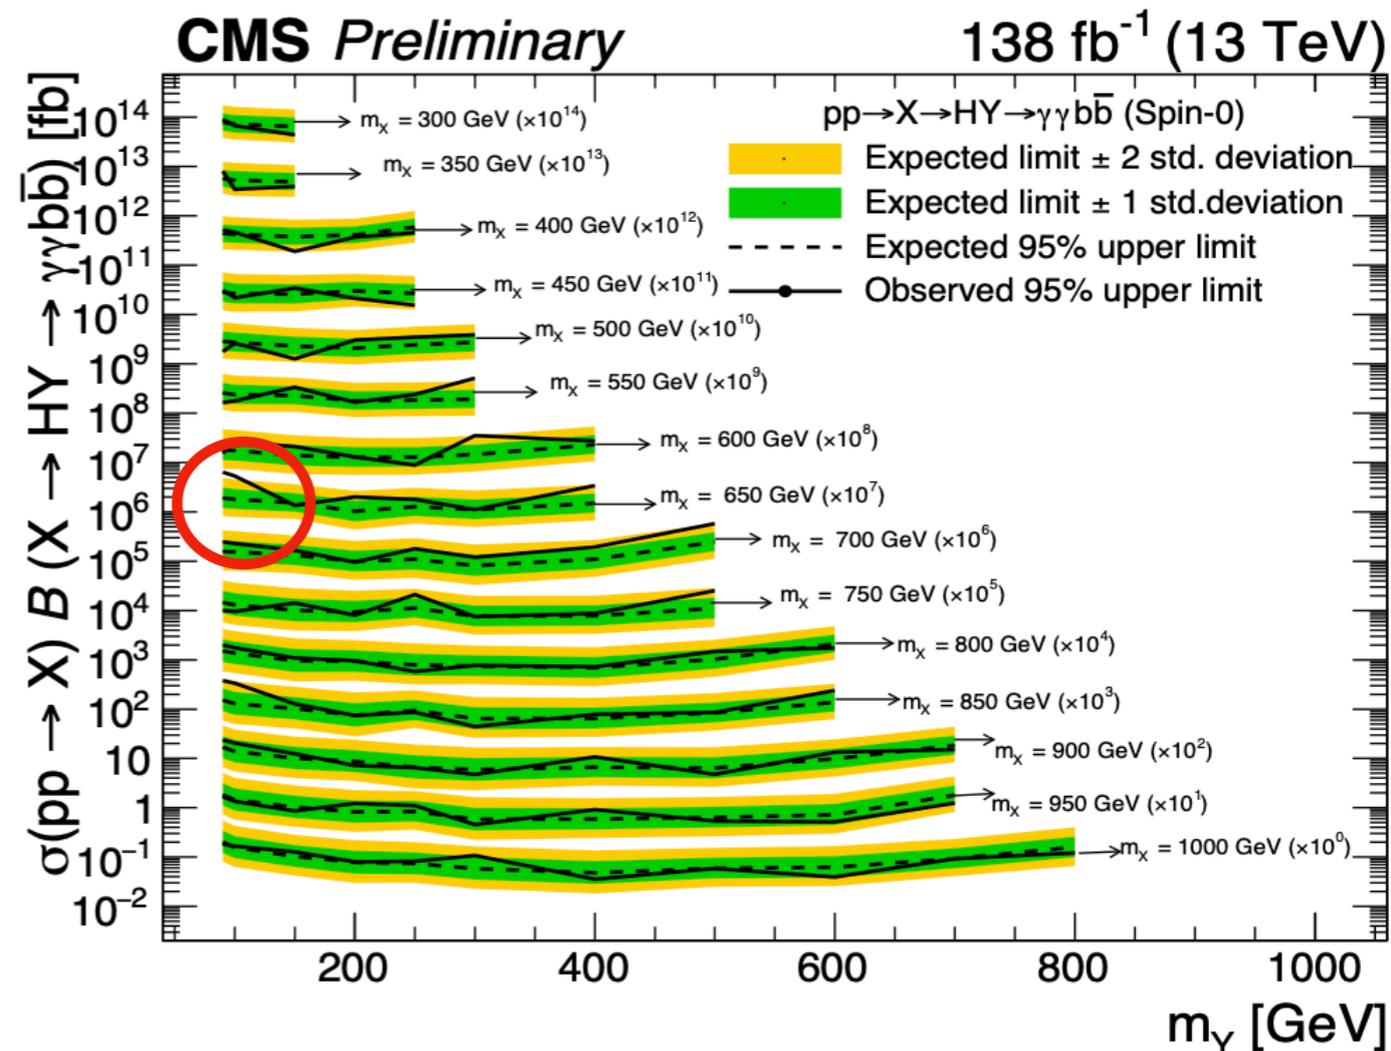

[HIG-21-011](#)

(Results in bbbb (boosted) and bbWW final state in backup)

- In this search we consider  $h \rightarrow \gamma\gamma$  and  $Y \rightarrow bb$  decays
- Largest excess for  $m_Y = 90$  GeV,  
 $m_X = 650$  GeV

- Local (global) significance of 3.8 (2.8) $\sigma$  @  $m_Y = 90$  GeV
- Note global significance only accounts for the  $m_Y < 150$  GeV search range
- Local significance of 3.5 $\sigma$  @  $m_Y = 100$  GeV

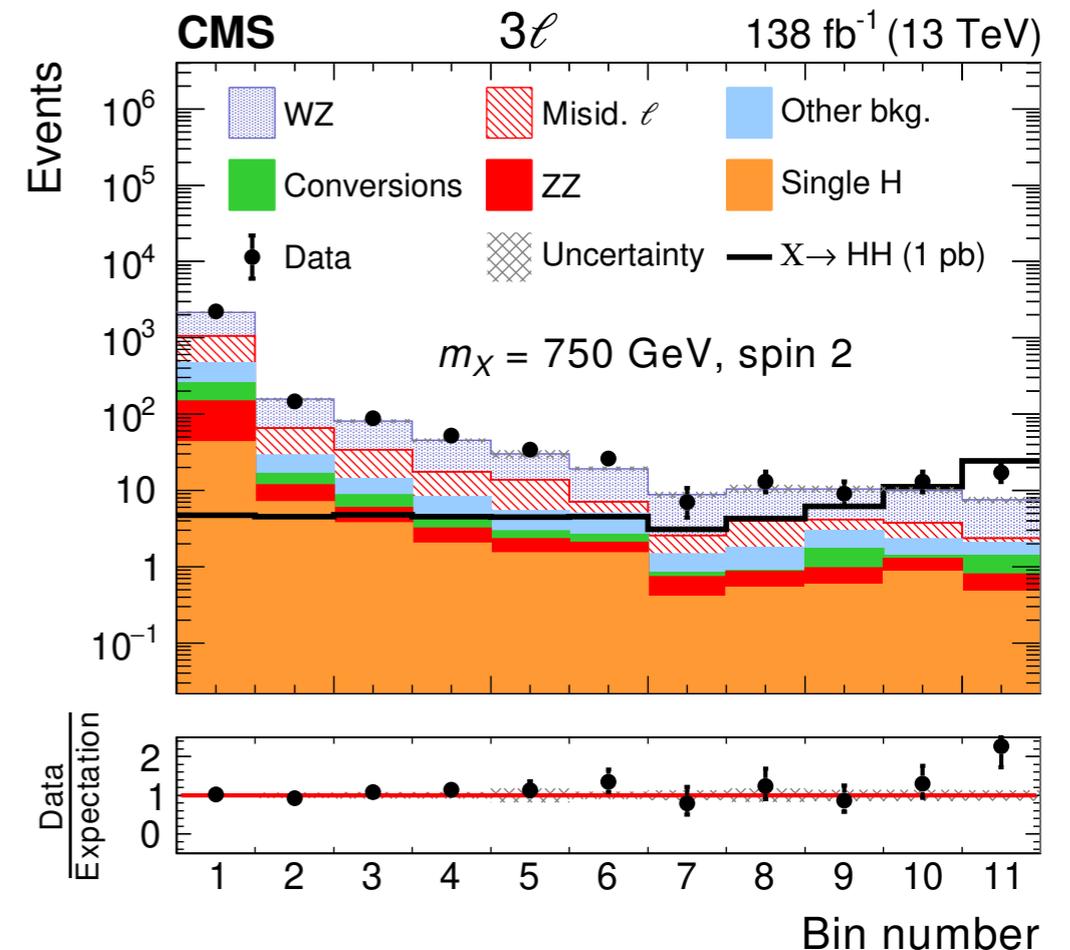

[HIG-21-011](#)

(Results in bbbb (boosted) and bbττ final state in backup)

# H → hh → multilepton

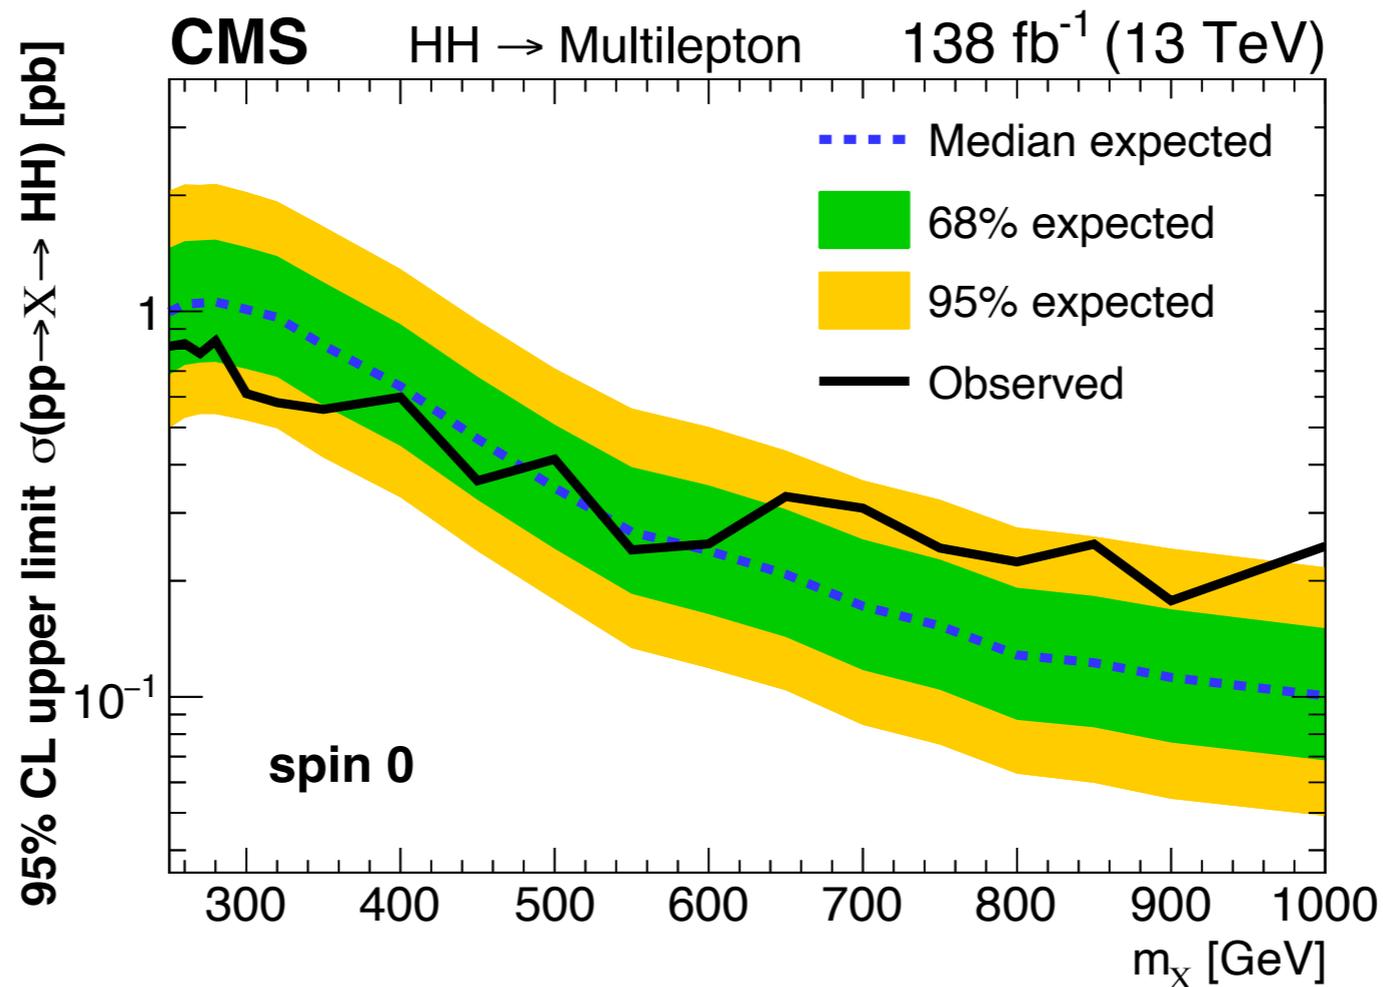

- H → hh typically split by h final state
  - Different final states can probe different H mass regions (branching-ratios vs signal purity)
- Most recent new result by CMS considers “multilepton” final state
  - This covers  $h \rightarrow WW / \tau\tau$  decays
- Split events into channels depending on number of light leptons and  $\tau_h$  in final state
- BDT to separate signal and background
  - Fit output score to extract results

[HIG-21-002](#)

# H → hh → multilepton

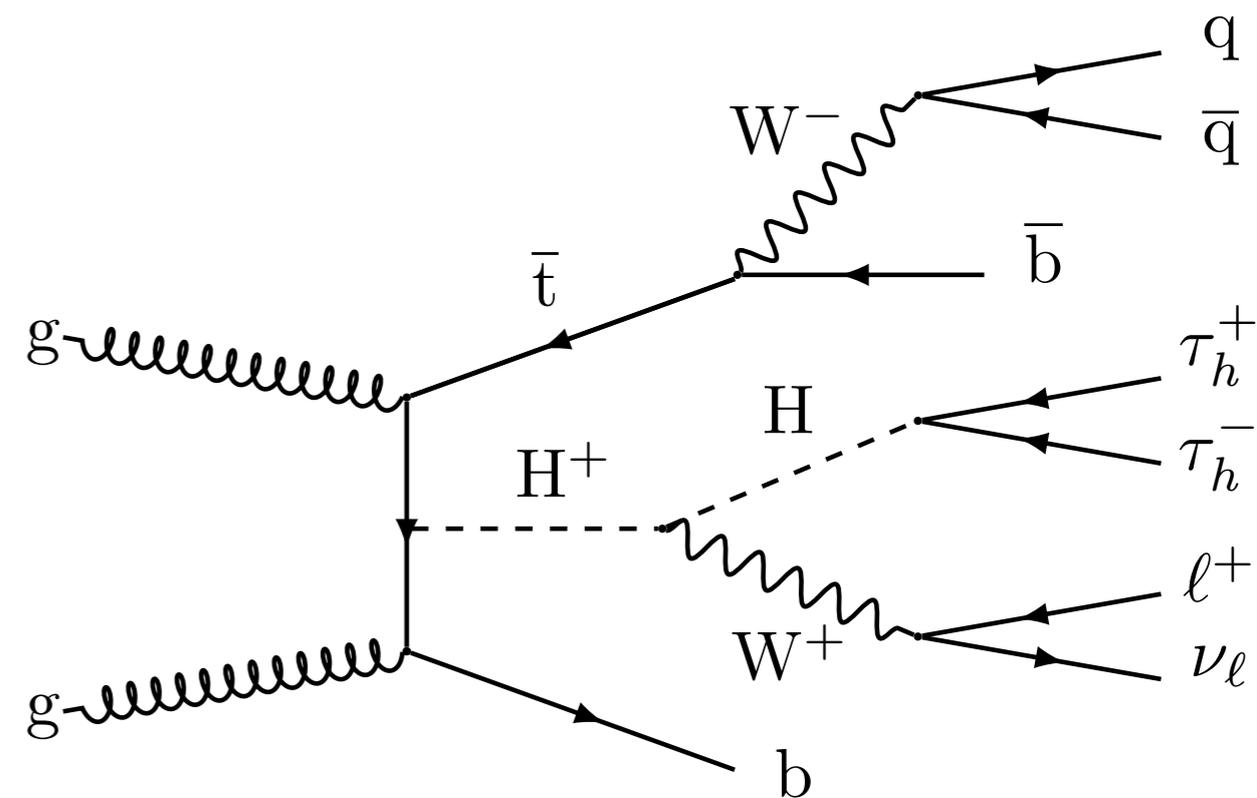

- Overall the data consistent with background-only hypothesis
- Limits set of cross-section for spin 0 and spin 2 hypotheses

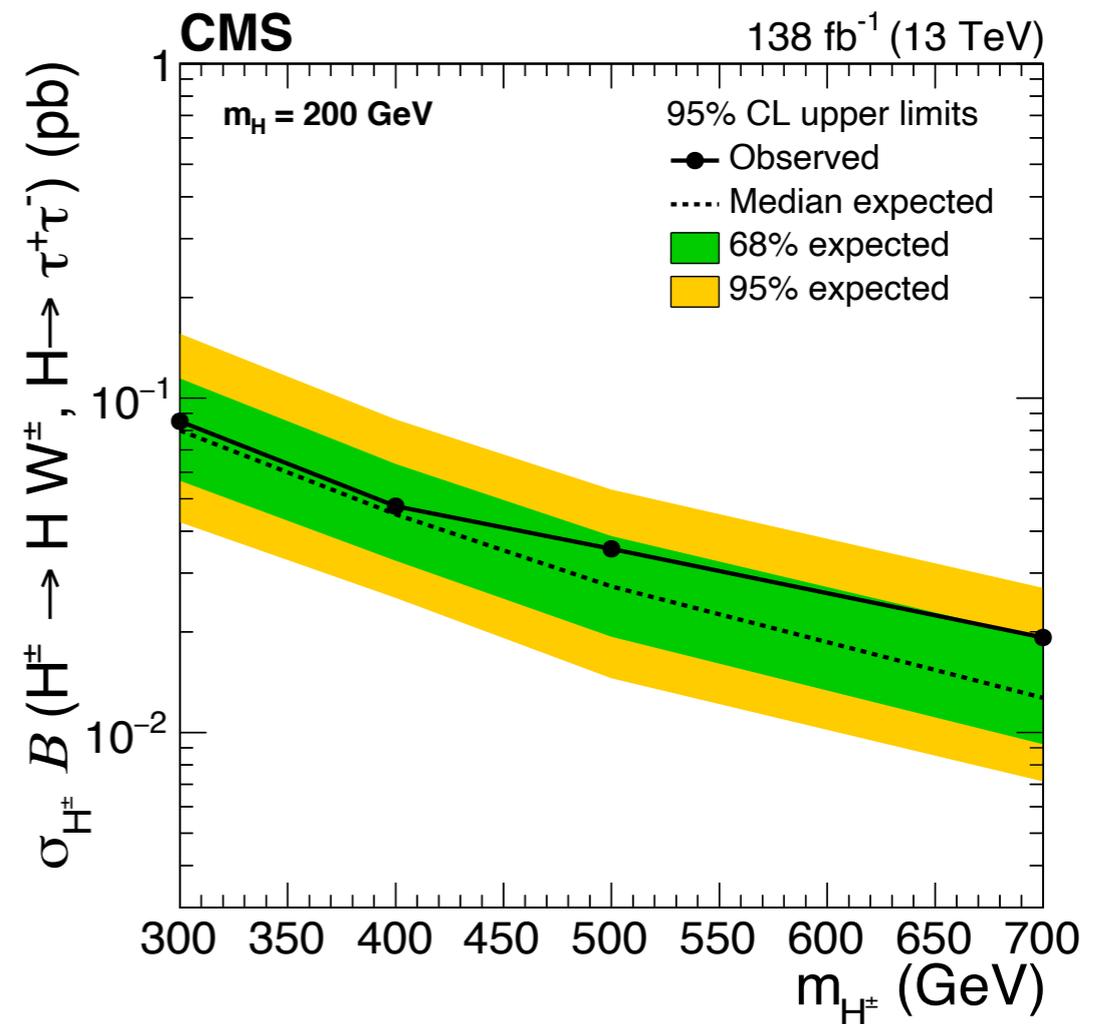

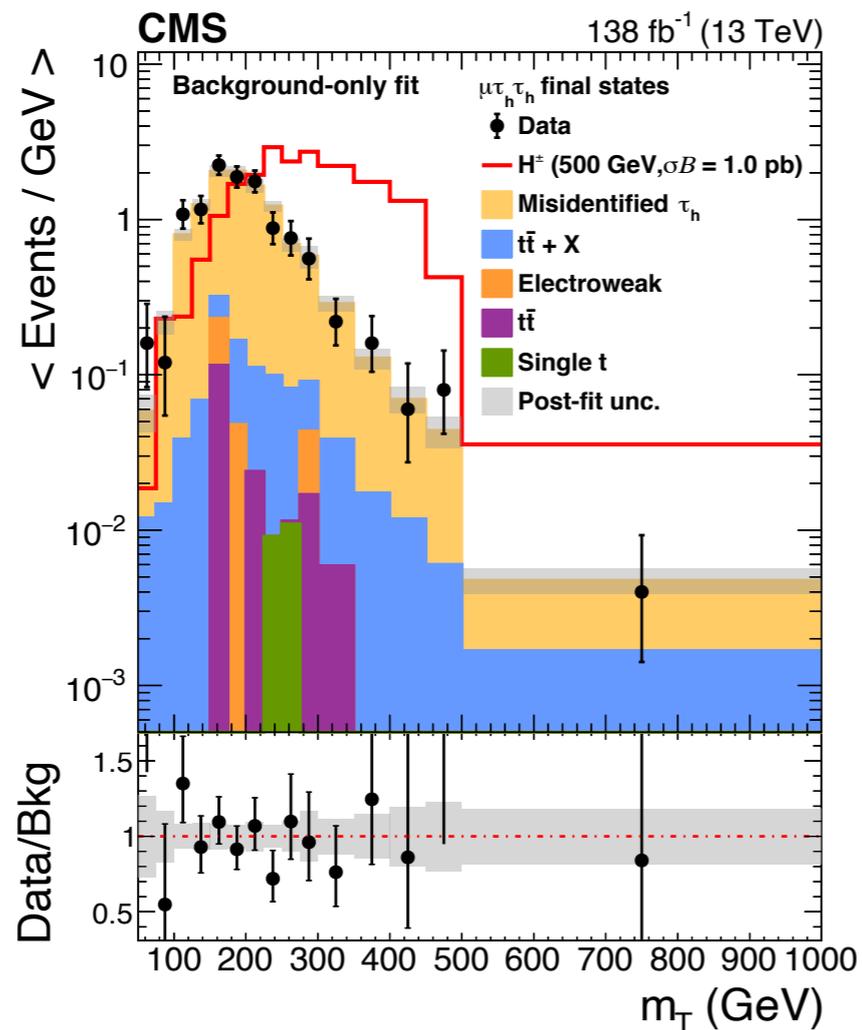

[HIG-21-002](#)

# Charged Higgs

- Search for  $H^\pm$  decaying into  $WH$  ( $m_H=200$  GeV)
- Produced in association with top quark
  - Tag hadronic top decays identified using resolved top quark tagger based on neural network (NN)
- $H$  reconstructed in  $\tau\tau$  final state
  - $\tau\tau$  decays into  $\tau_h\tau_h, \mu\tau_h, \text{ or } e\tau_h$  pairs
- May also get additional lepton from  $W$ 
  - Split into 4 most sensitive channels:  
 $\mu\tau_h\tau_h, e\tau_h\tau_h, \mu\tau_h, e\tau_h$

- Discriminating variables:
  - $l\tau_h\tau_h$  channels: transverse mass of  $H^\pm$  ( $m_T$ )
  - $l\tau_h$  channels: BDT based discriminant
- No statistically significant excess observed - set limits on cross-section vs  $m_{H^\pm}$

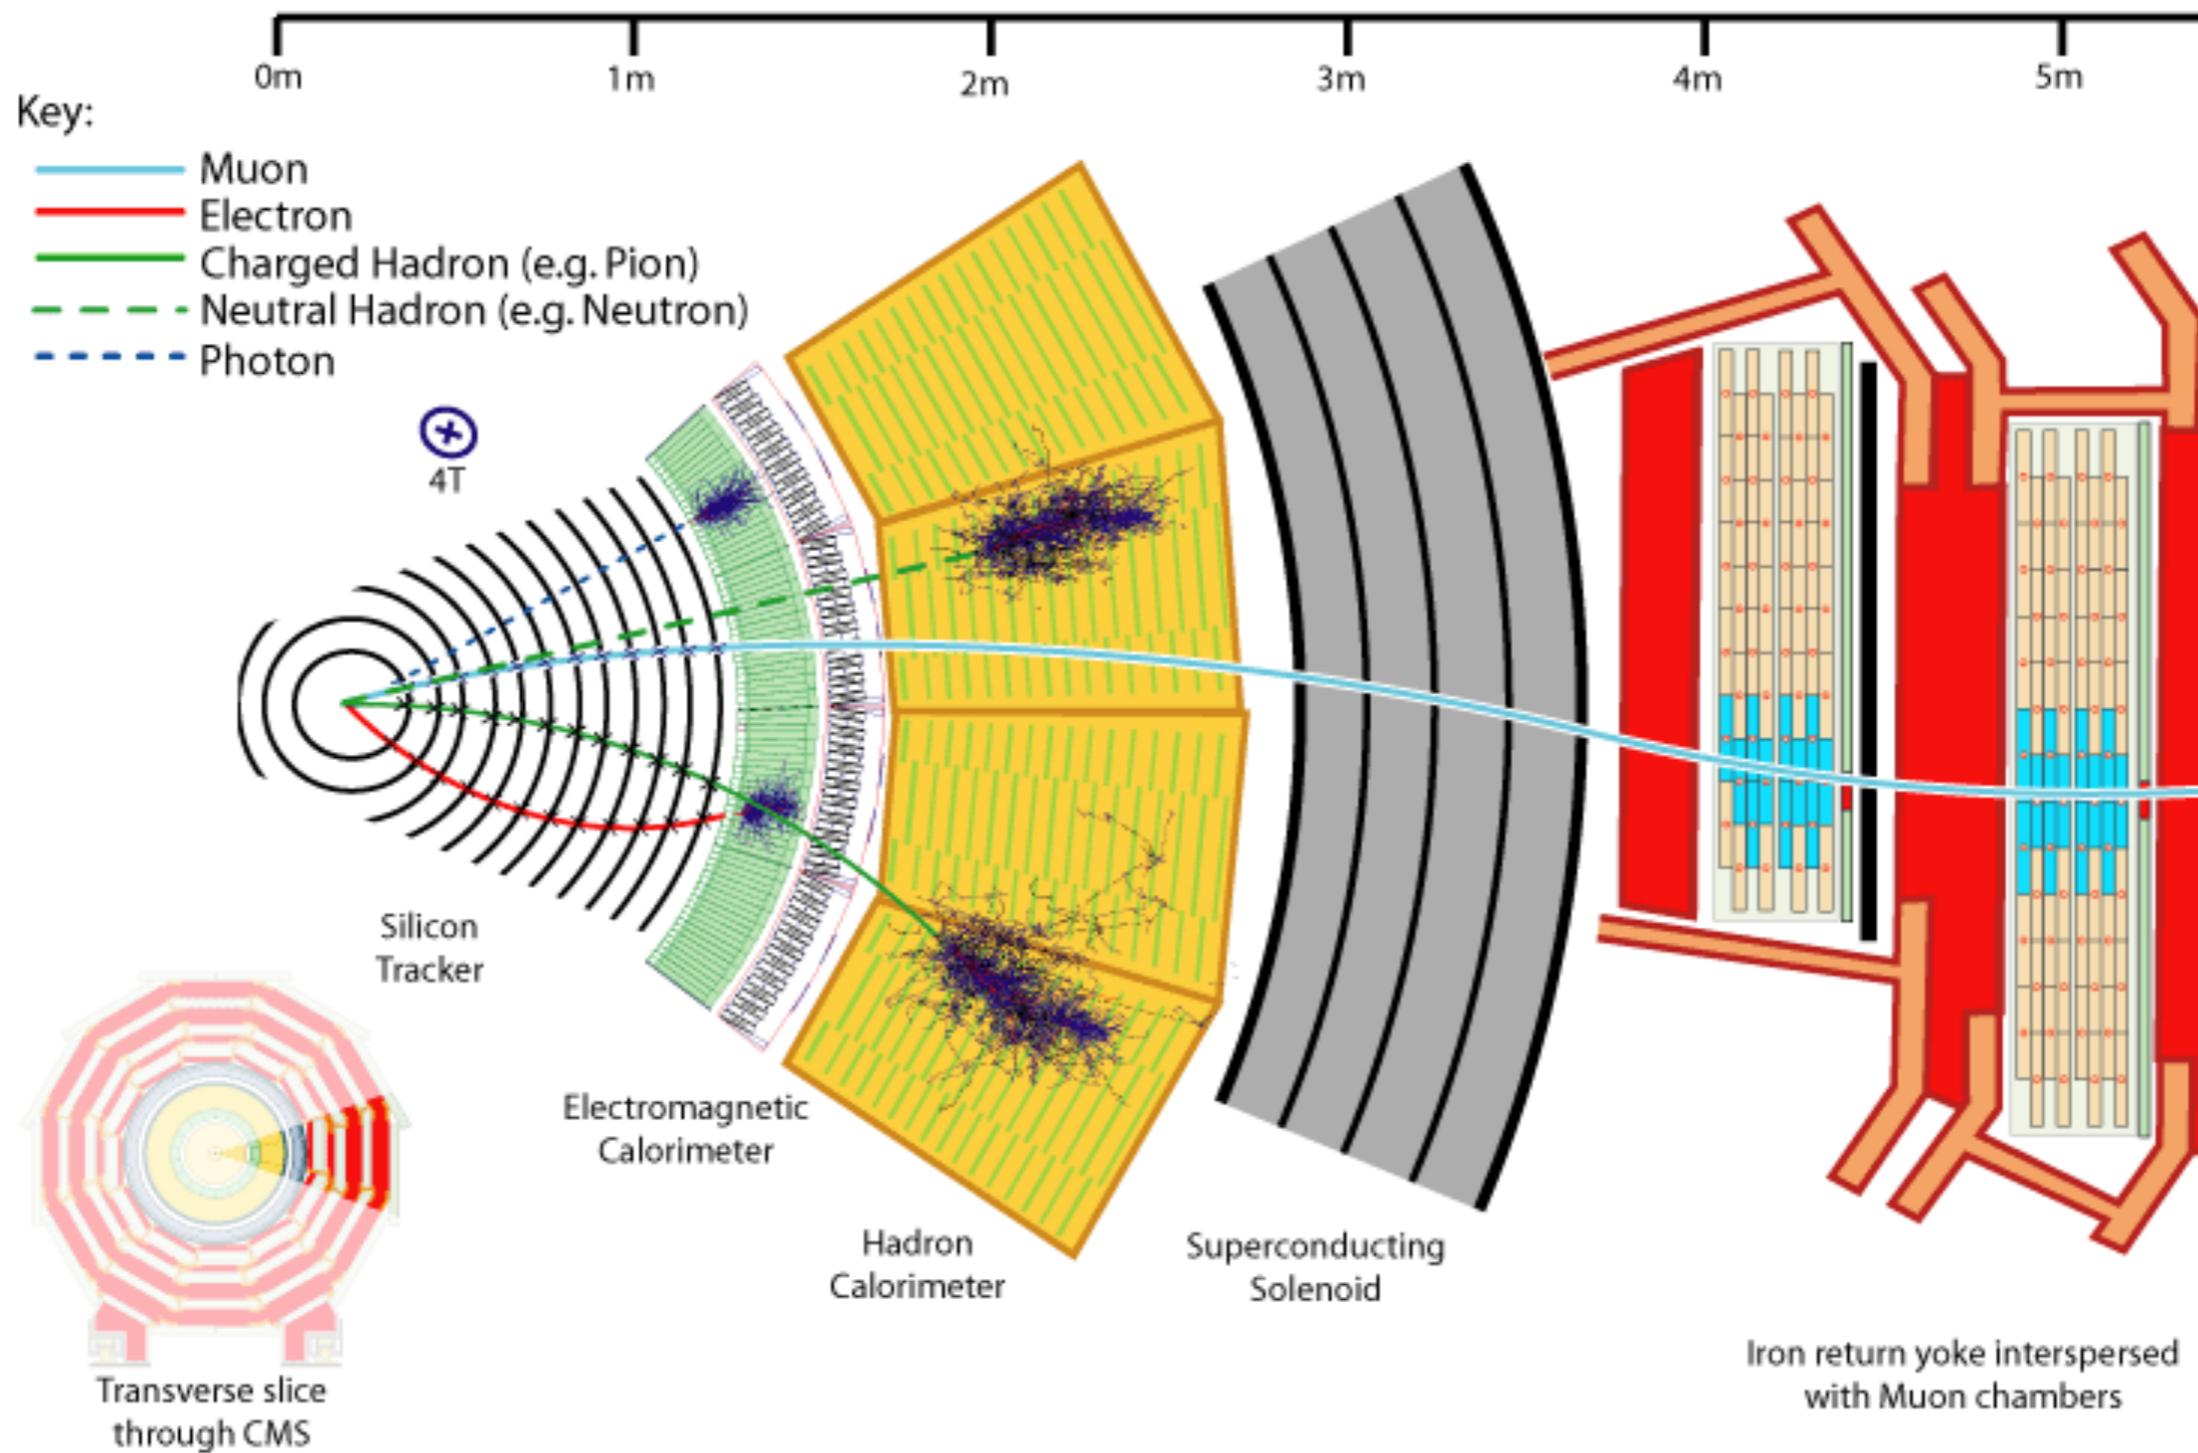

# Summary

- Presented the latest results from the CMS experiment in searches for extended Higgs sectors
- No conclusive signals observed yet, but a few interesting excesses!
- Several analyses using the Run 2 dataset expected in the near future
- Additionally Run 3 has begun, expect updates in the next few years

**Thanks for your attention!**

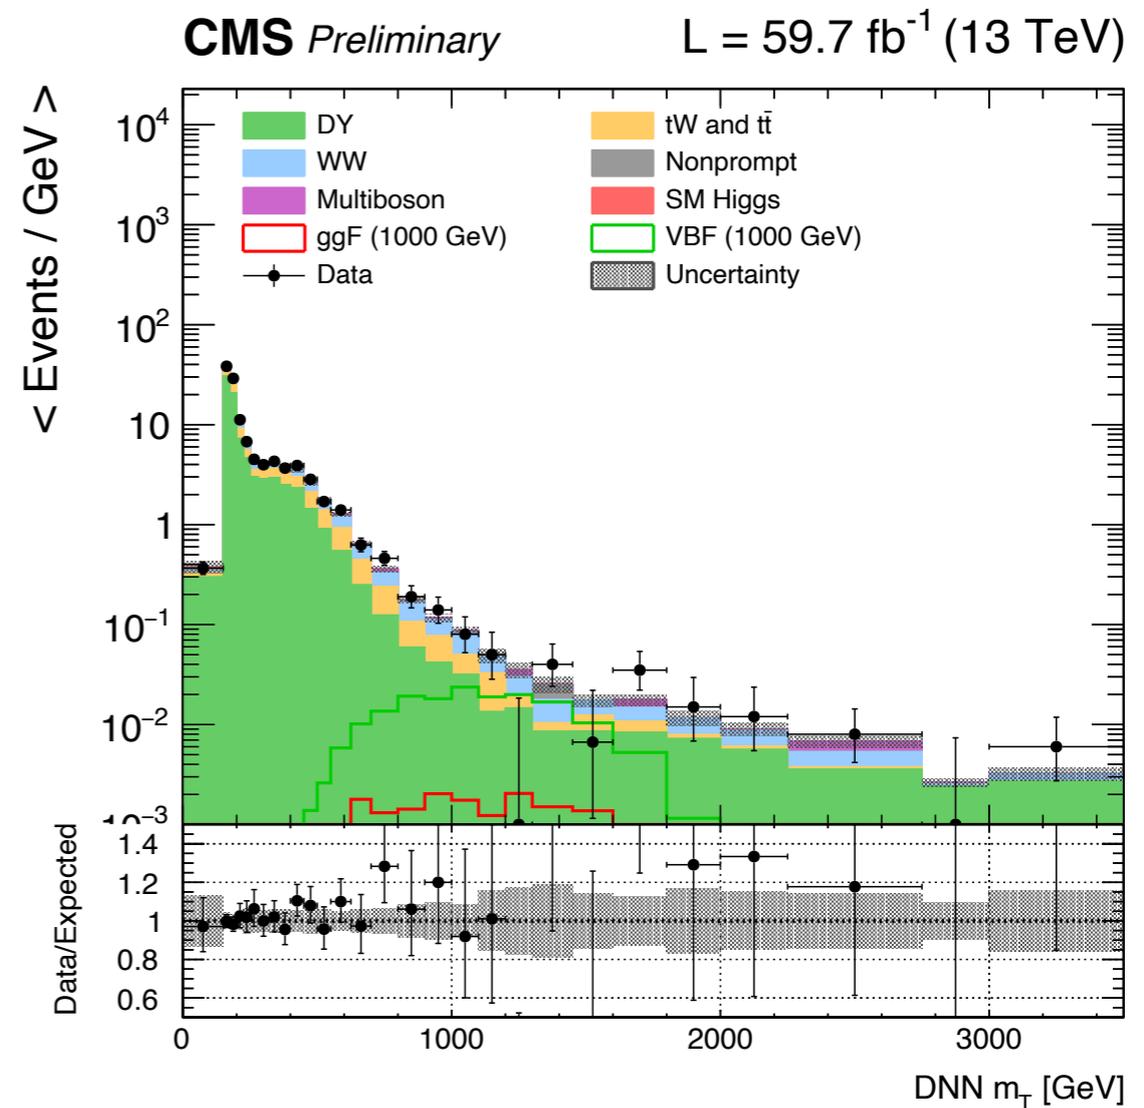

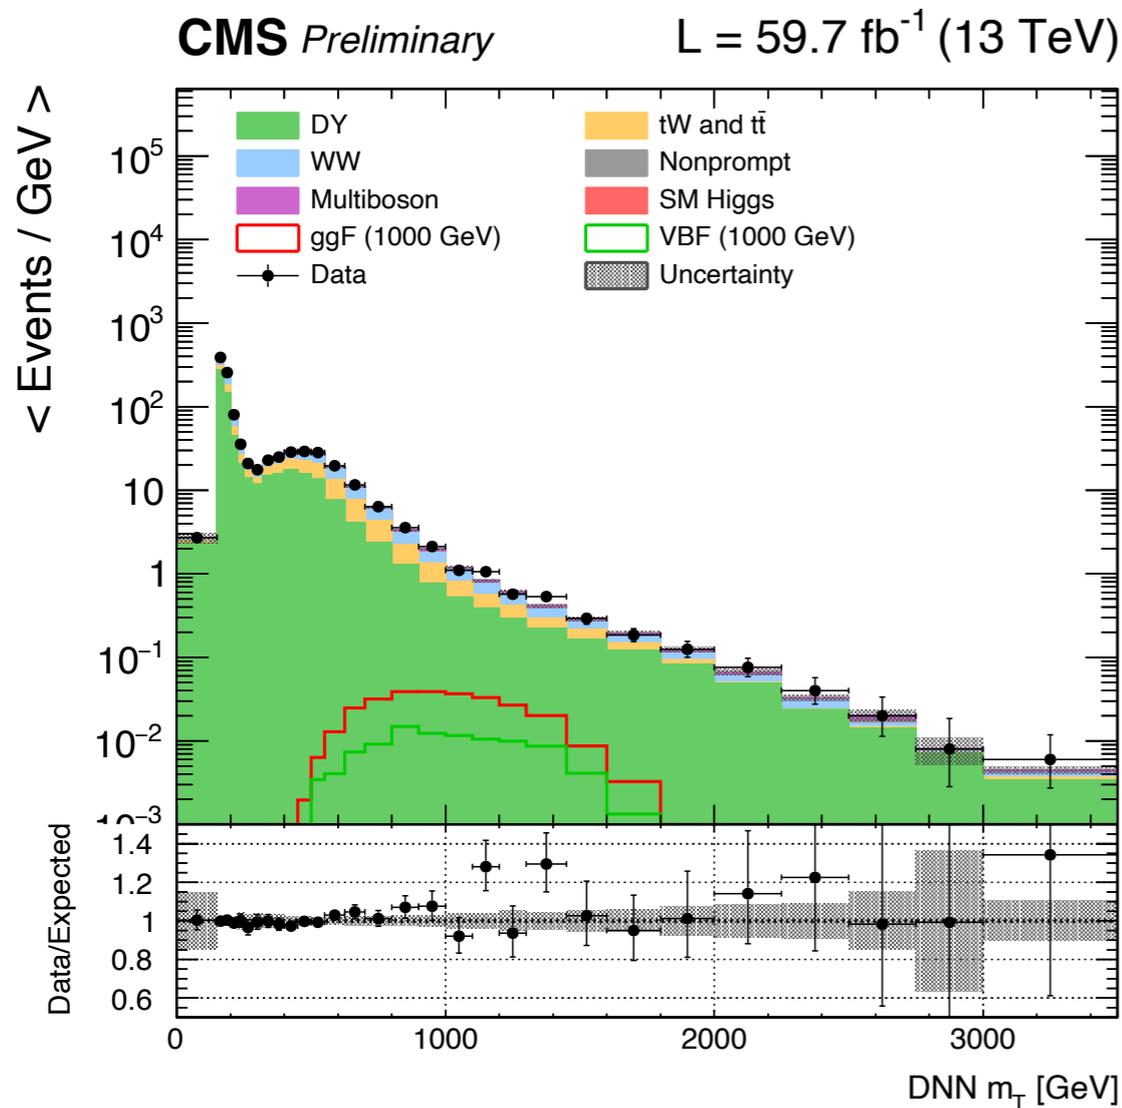

# Backup

# The CMS detector

# H → WW: Other fitted distributions

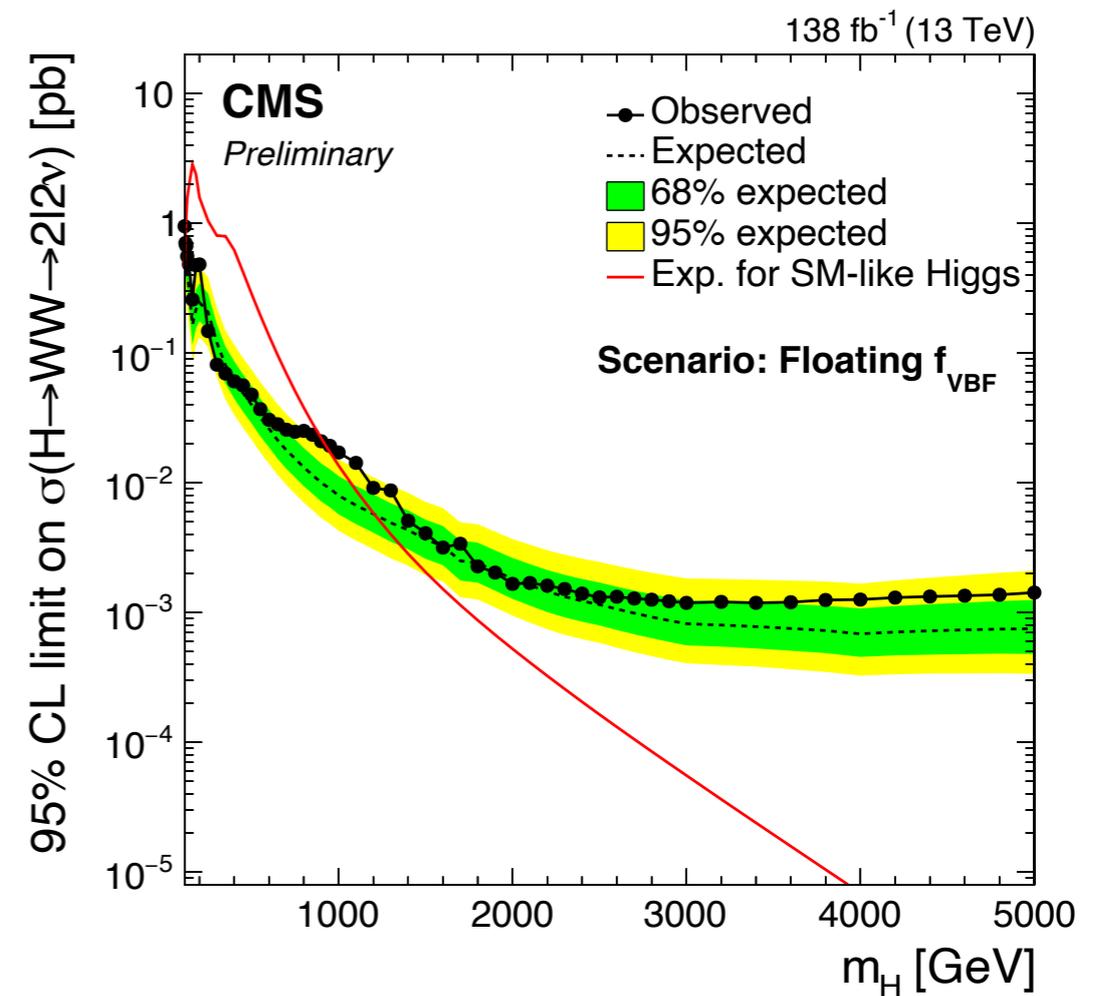

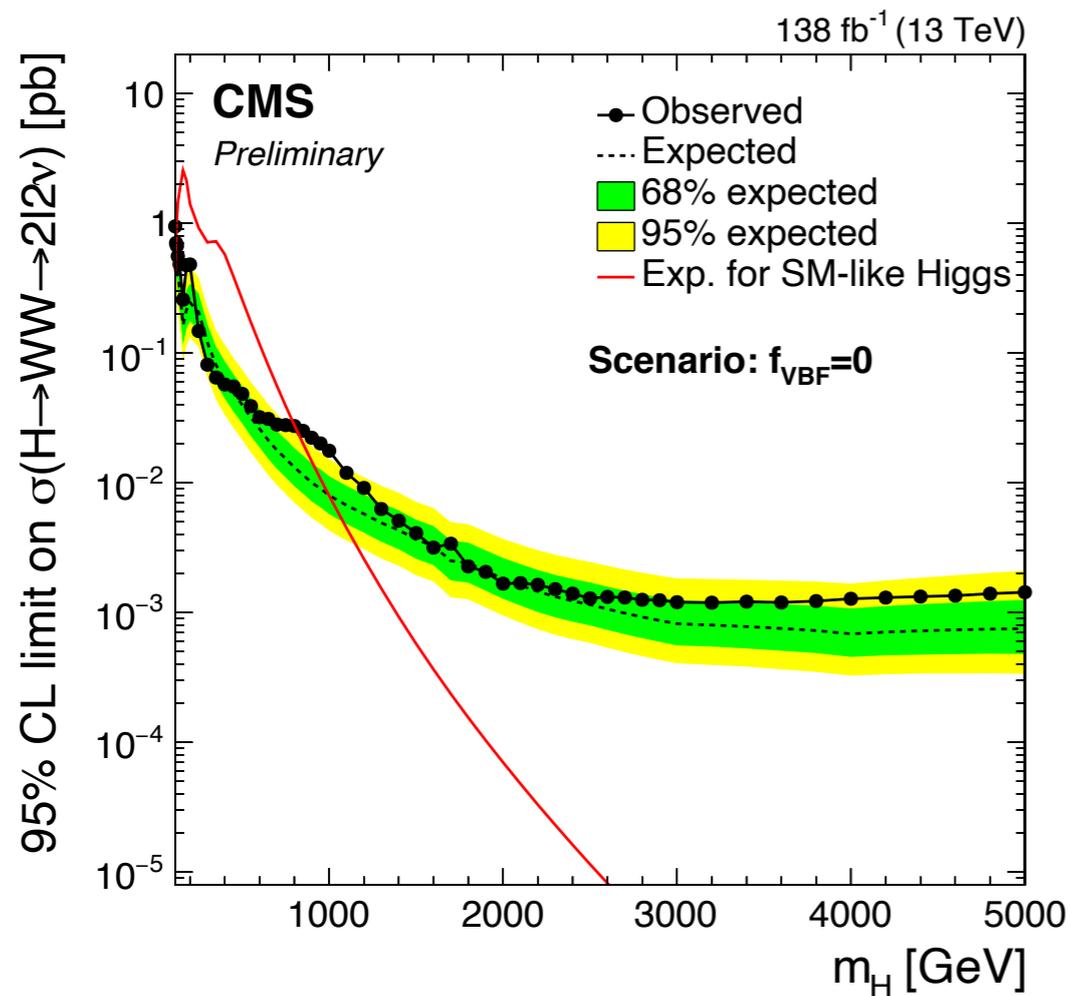

- Additional examples of fitted distribution for H → WW search in the  $\mu\mu$  final state

[HIG-20-016](#)

# H → WW: Other VBF assumption

- Additional examples of H → WW limits for ggϕ-only (left) and VBF-only (right) scenarios

[HIG-20-016](#)

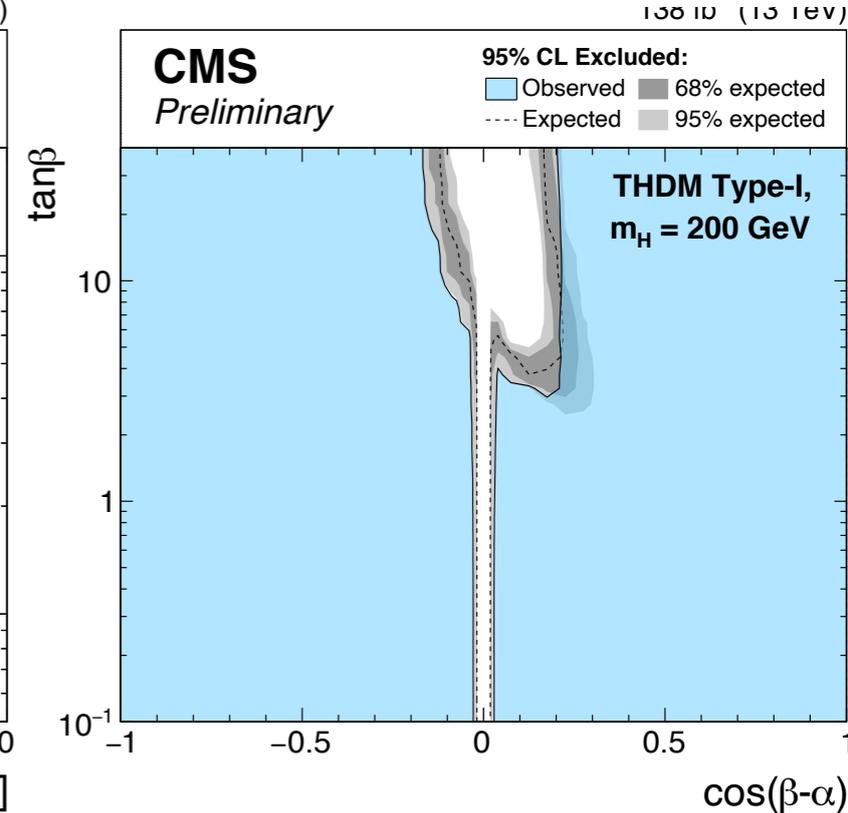

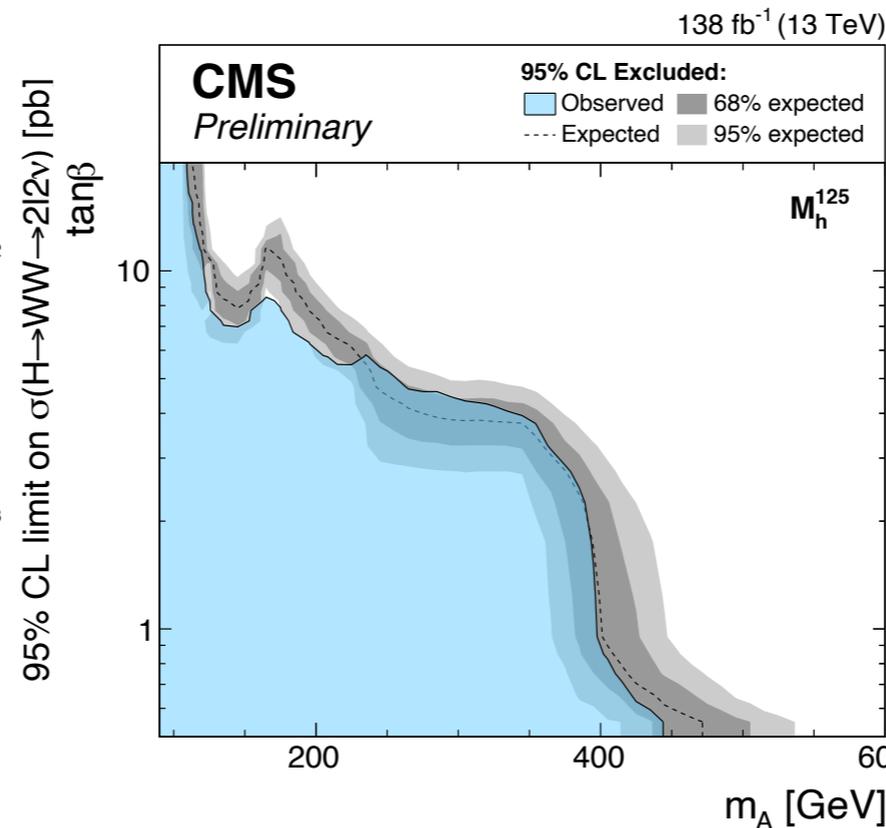

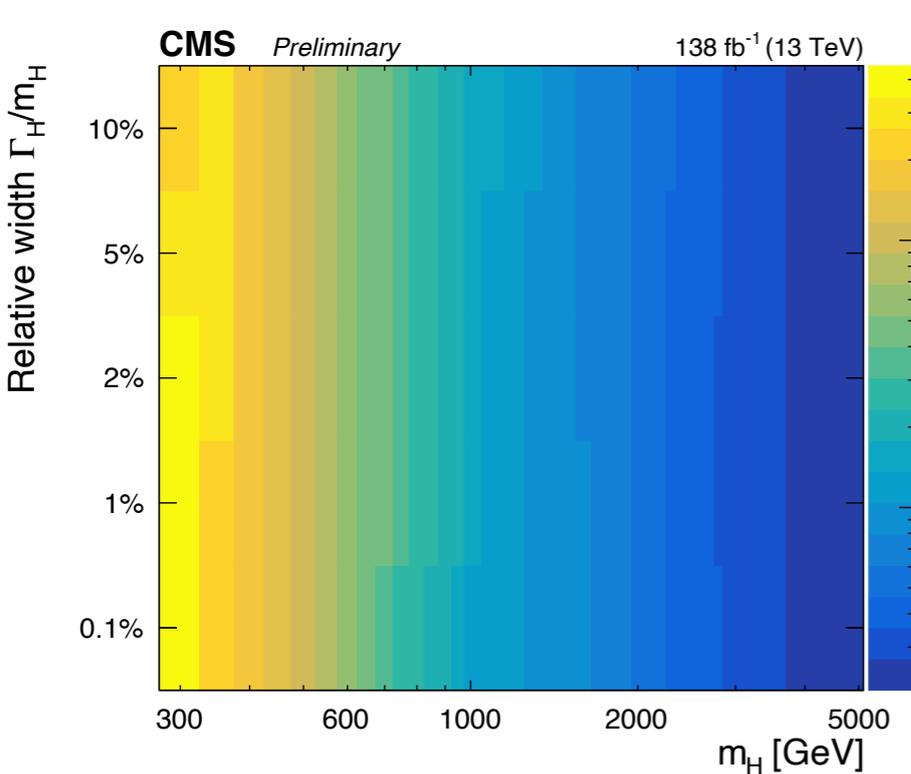

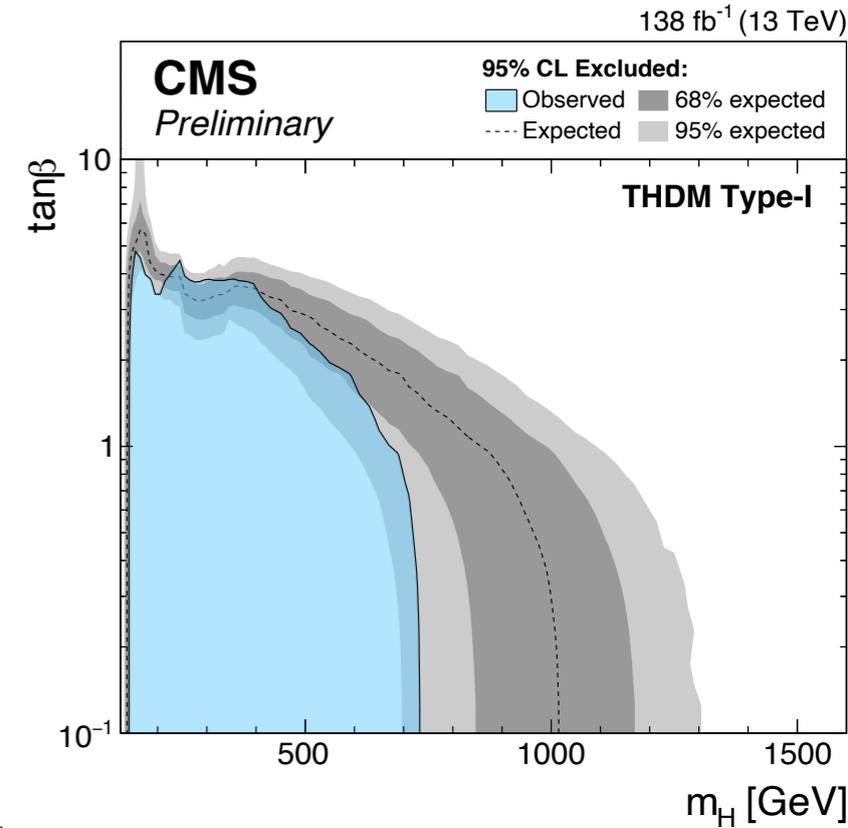

# H→WW: DNN

- Multiclass DNN separates VBF ggφ signal and backgrounds
- Trained on all signal mass hypotheses combined
- x,y, and z components of two leading leptons momenta
- x,y, and z components of four leading jets momenta, and their masses
- Djet mass and pseudorapidity separation for combinations of 4 leading jets
- Jet multiplicity
- x and y components of missing momentum
- H mass, di-lepton mass and di-lepton  $p_T$
- Scalar  $H_T$  sum of jets, leptons, and MET
- Several transverse mass quantities of leptons and MET
- Angular correlation between leptons, and between leptons and MET

[HIG-20-016](#)

# H → WW: Other interpretations

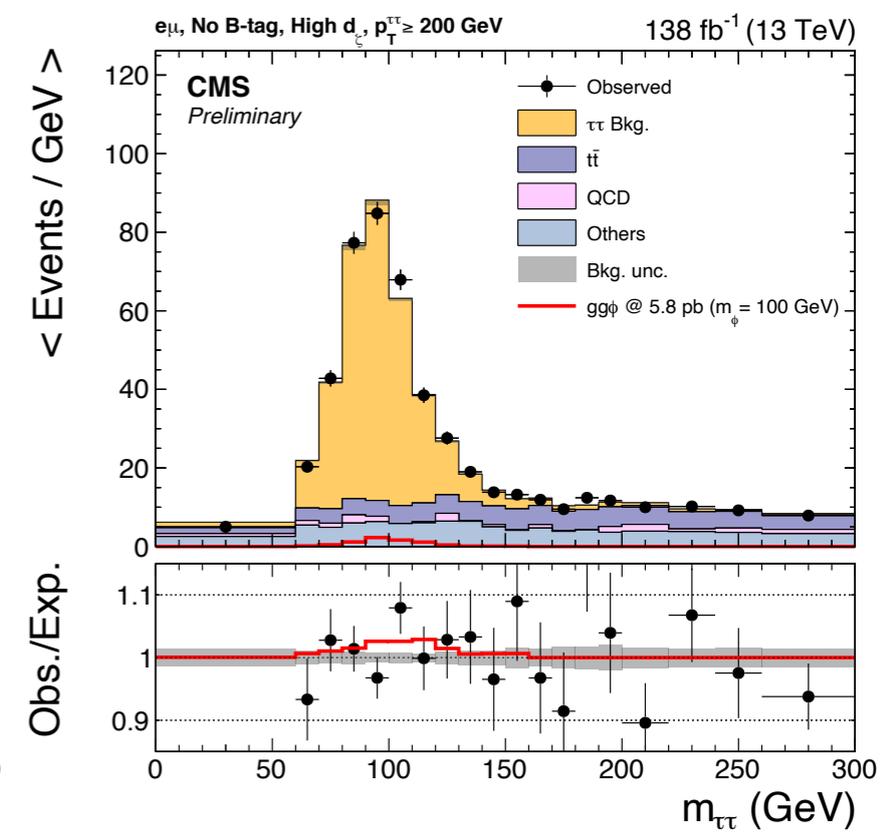

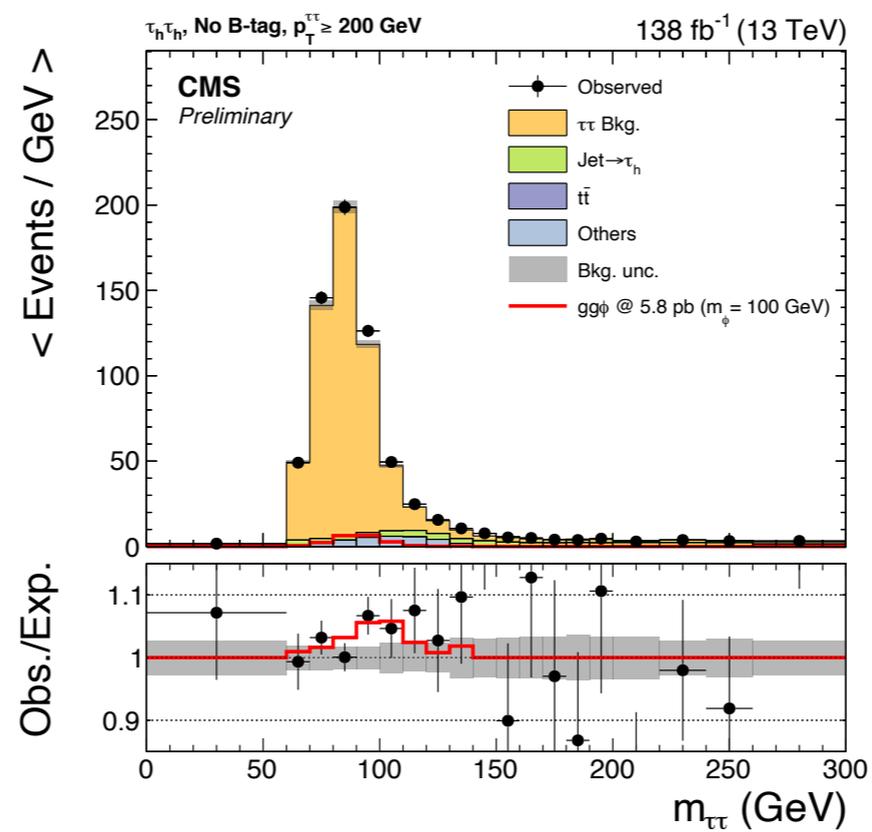

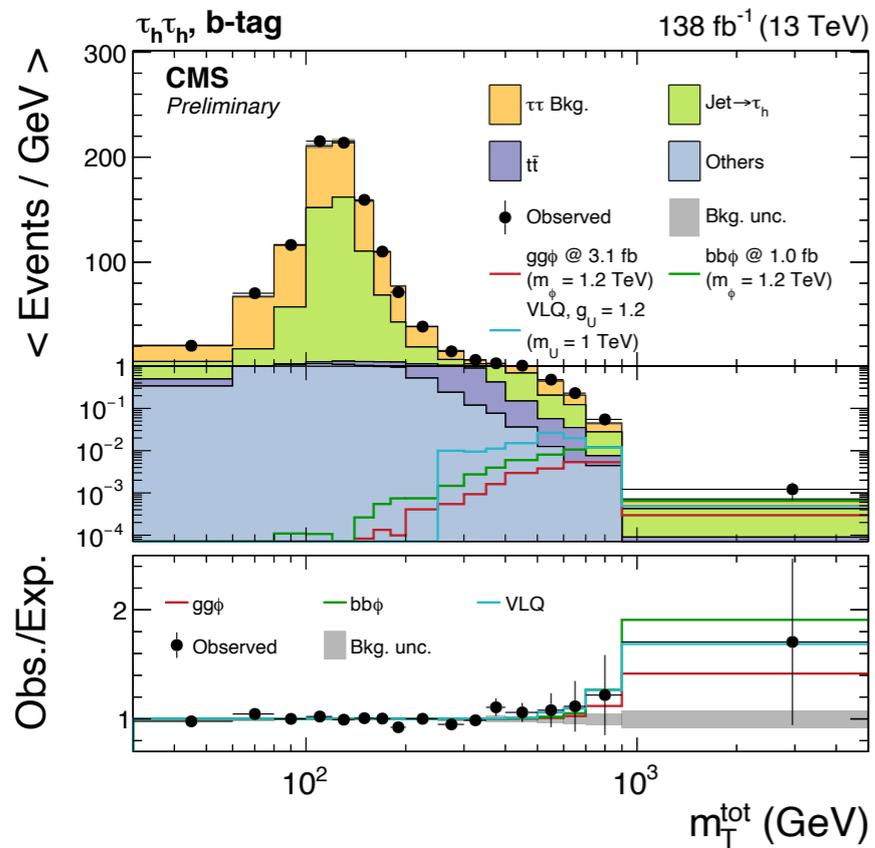

- Left: limits set for different width hypotheses
- Middle Limits set in alternative MSSM benchmark
- Limits set in 2HDM in  $\tan\beta$  vs  $\cos(\beta-\alpha)$  plane

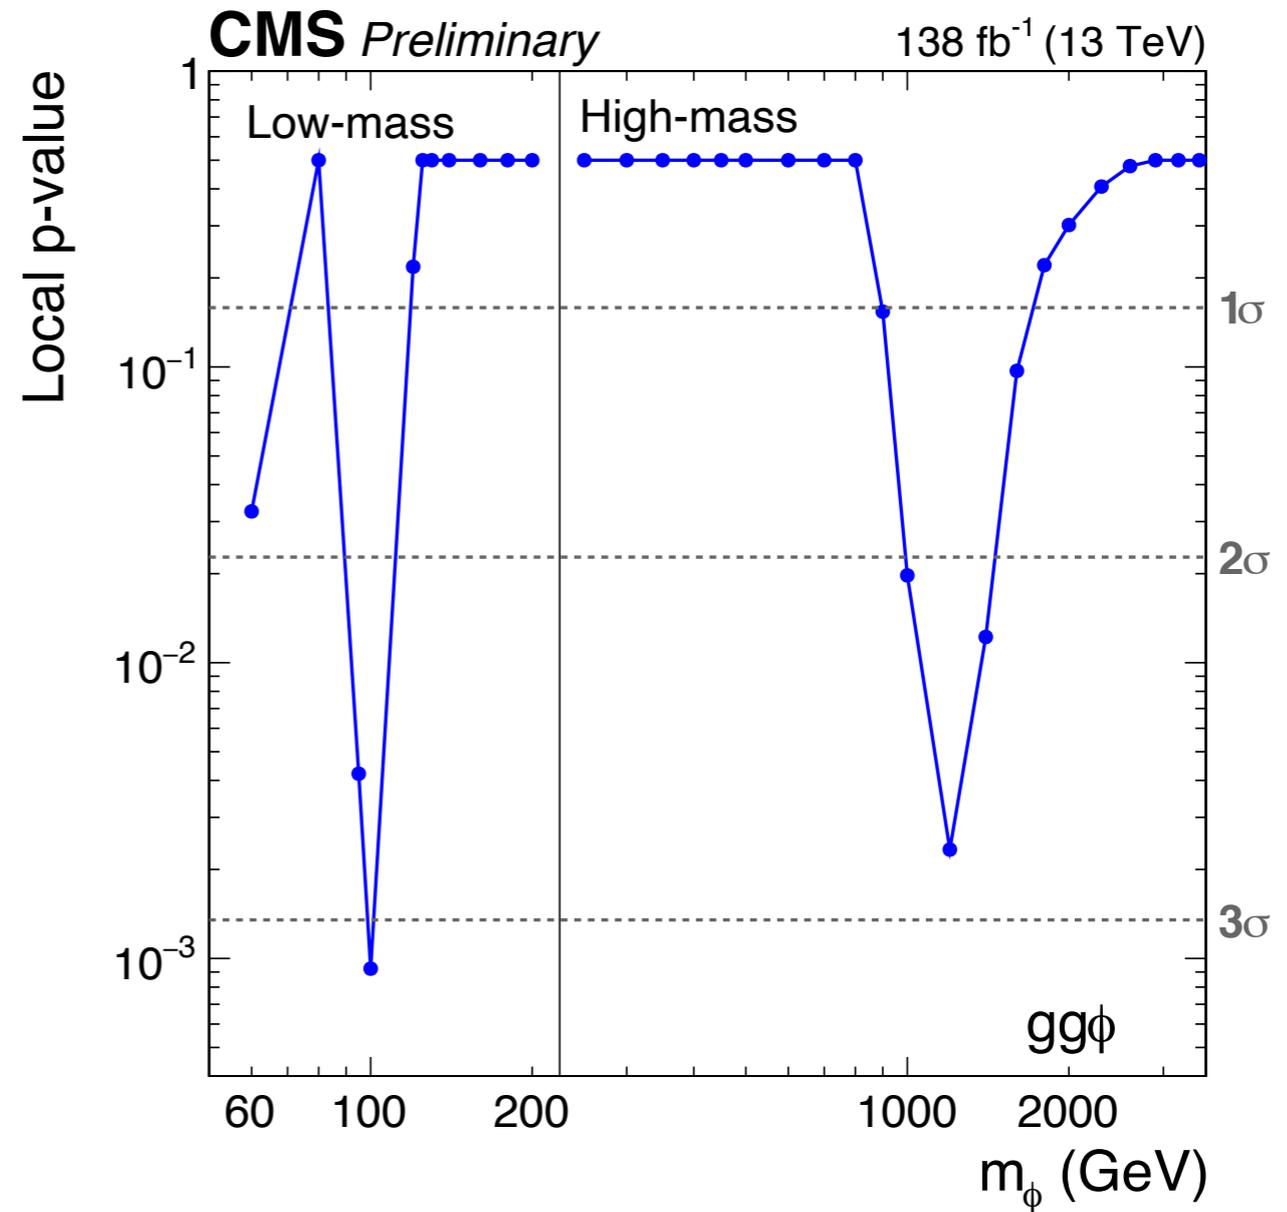

[HIG-20-016](#)

# H/A $\rightarrow \tau\tau$ : Other fitted distributions

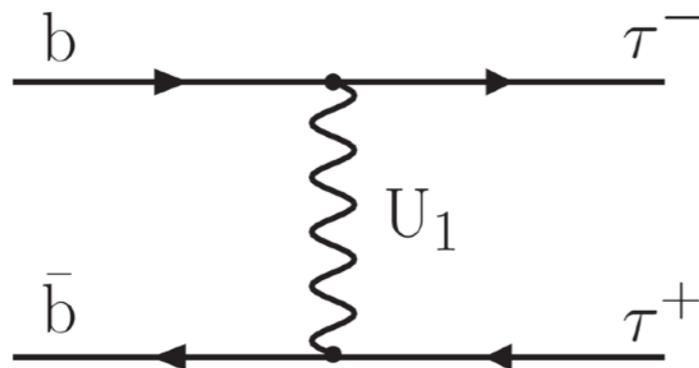

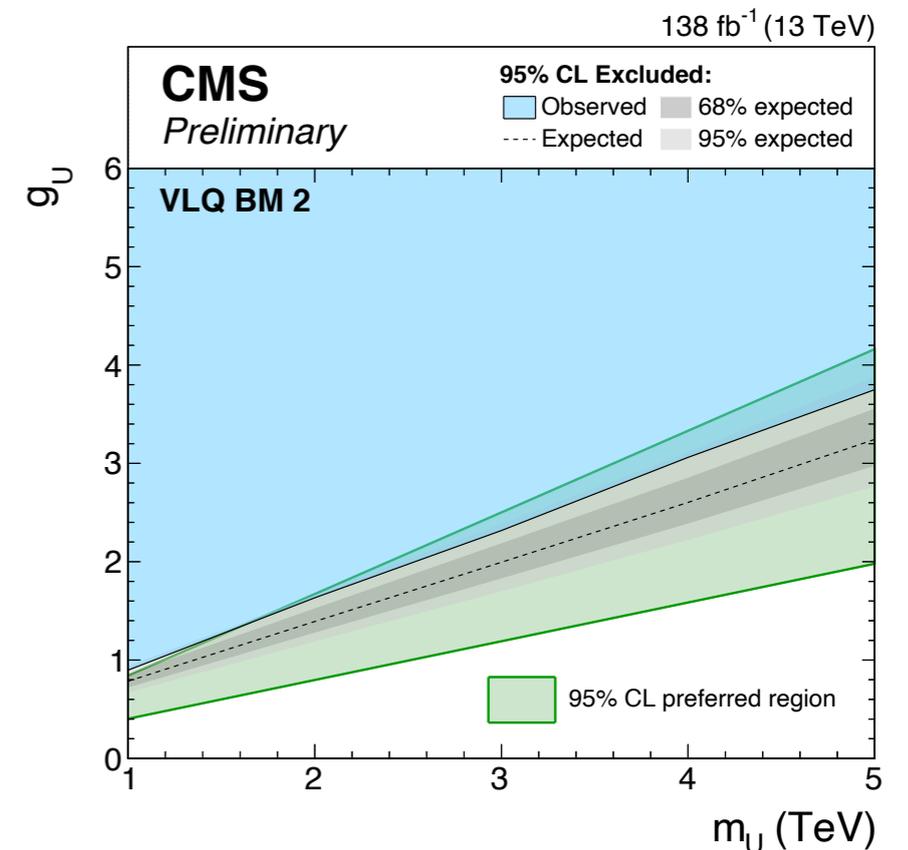

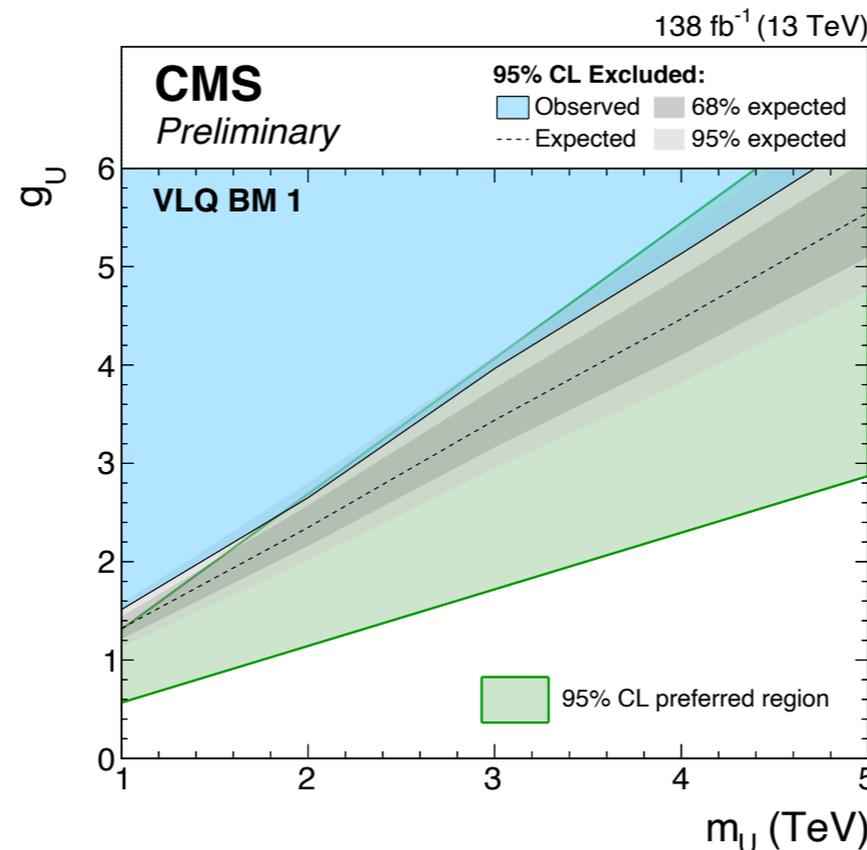

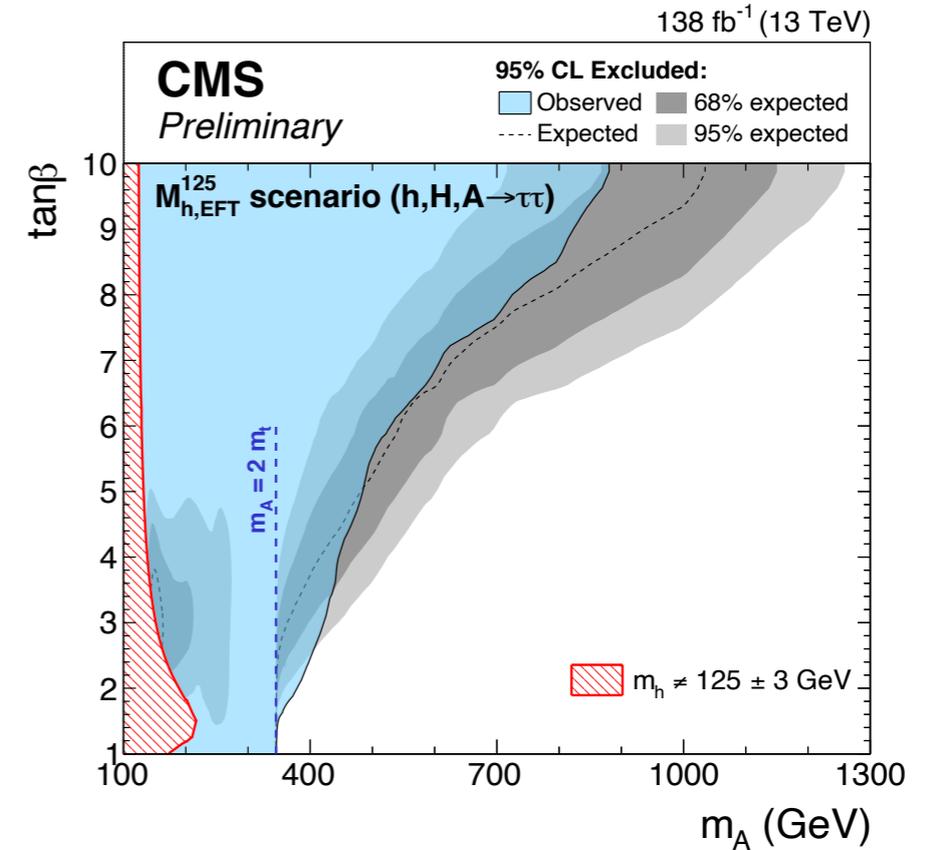

- Additional examples of fitted distribution for H/A  $\rightarrow \tau\tau$  searches

- Significances as a function of mass

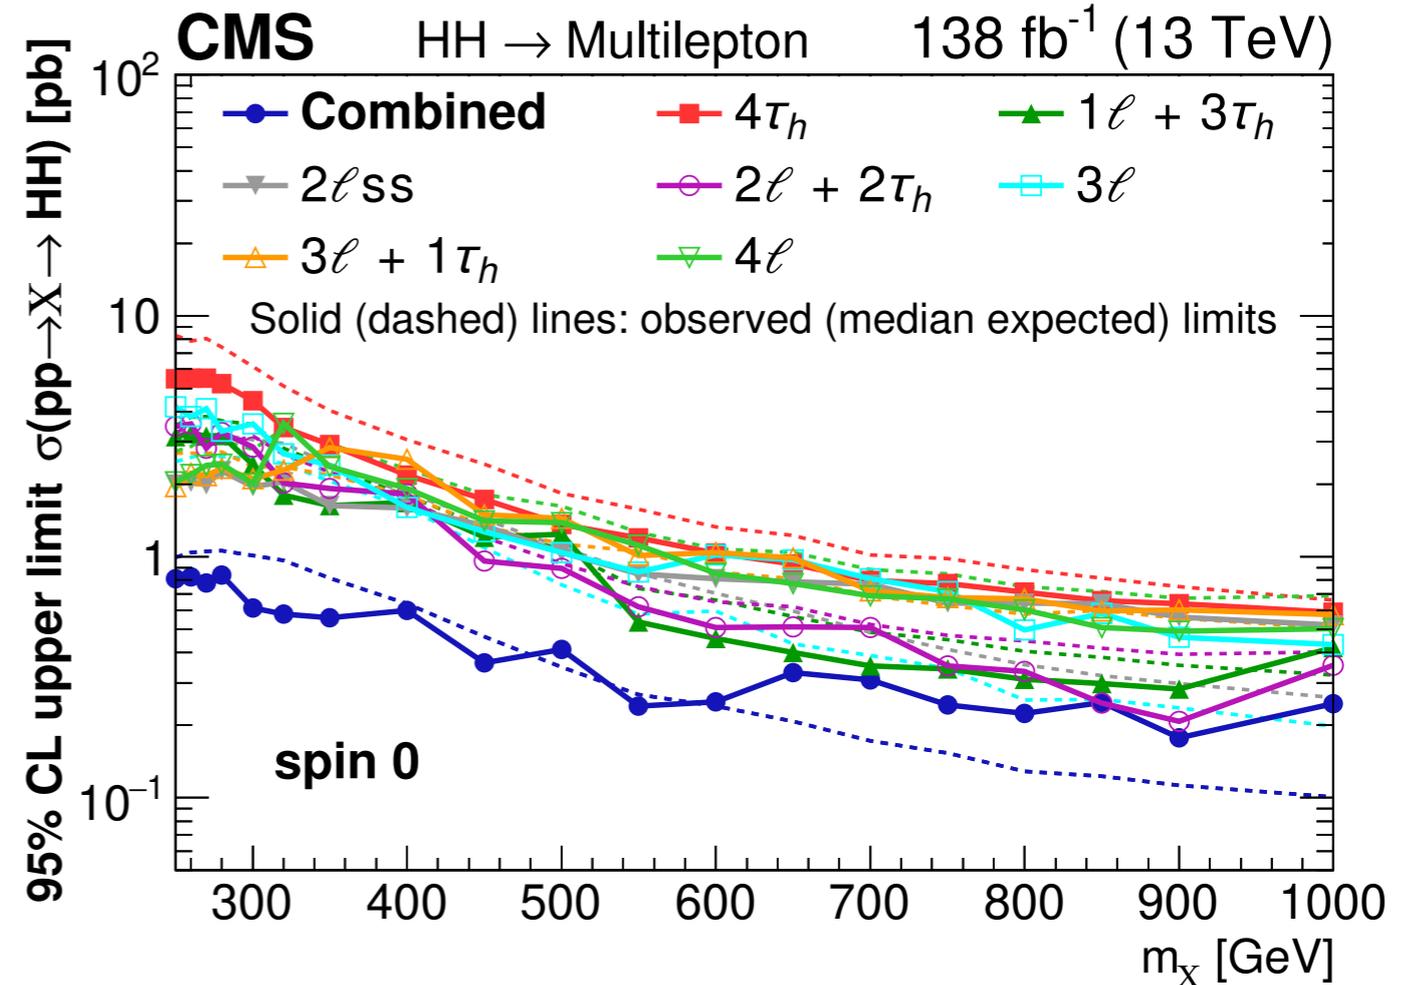

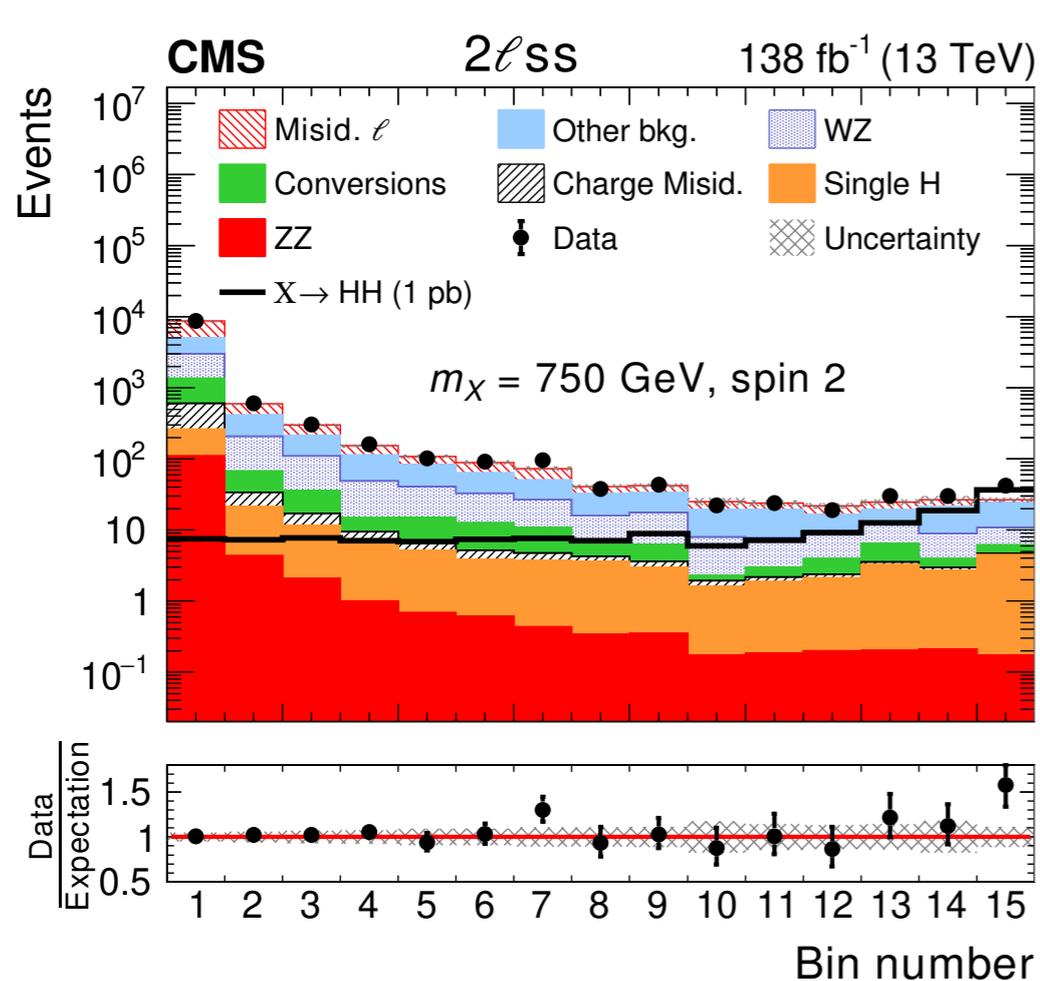

- Additional MSSM benchmark scenario considered
- Also interest results in models with vector-leptoquark (t-channel exchange)

HIG-21-001

# H → hh → multilepton

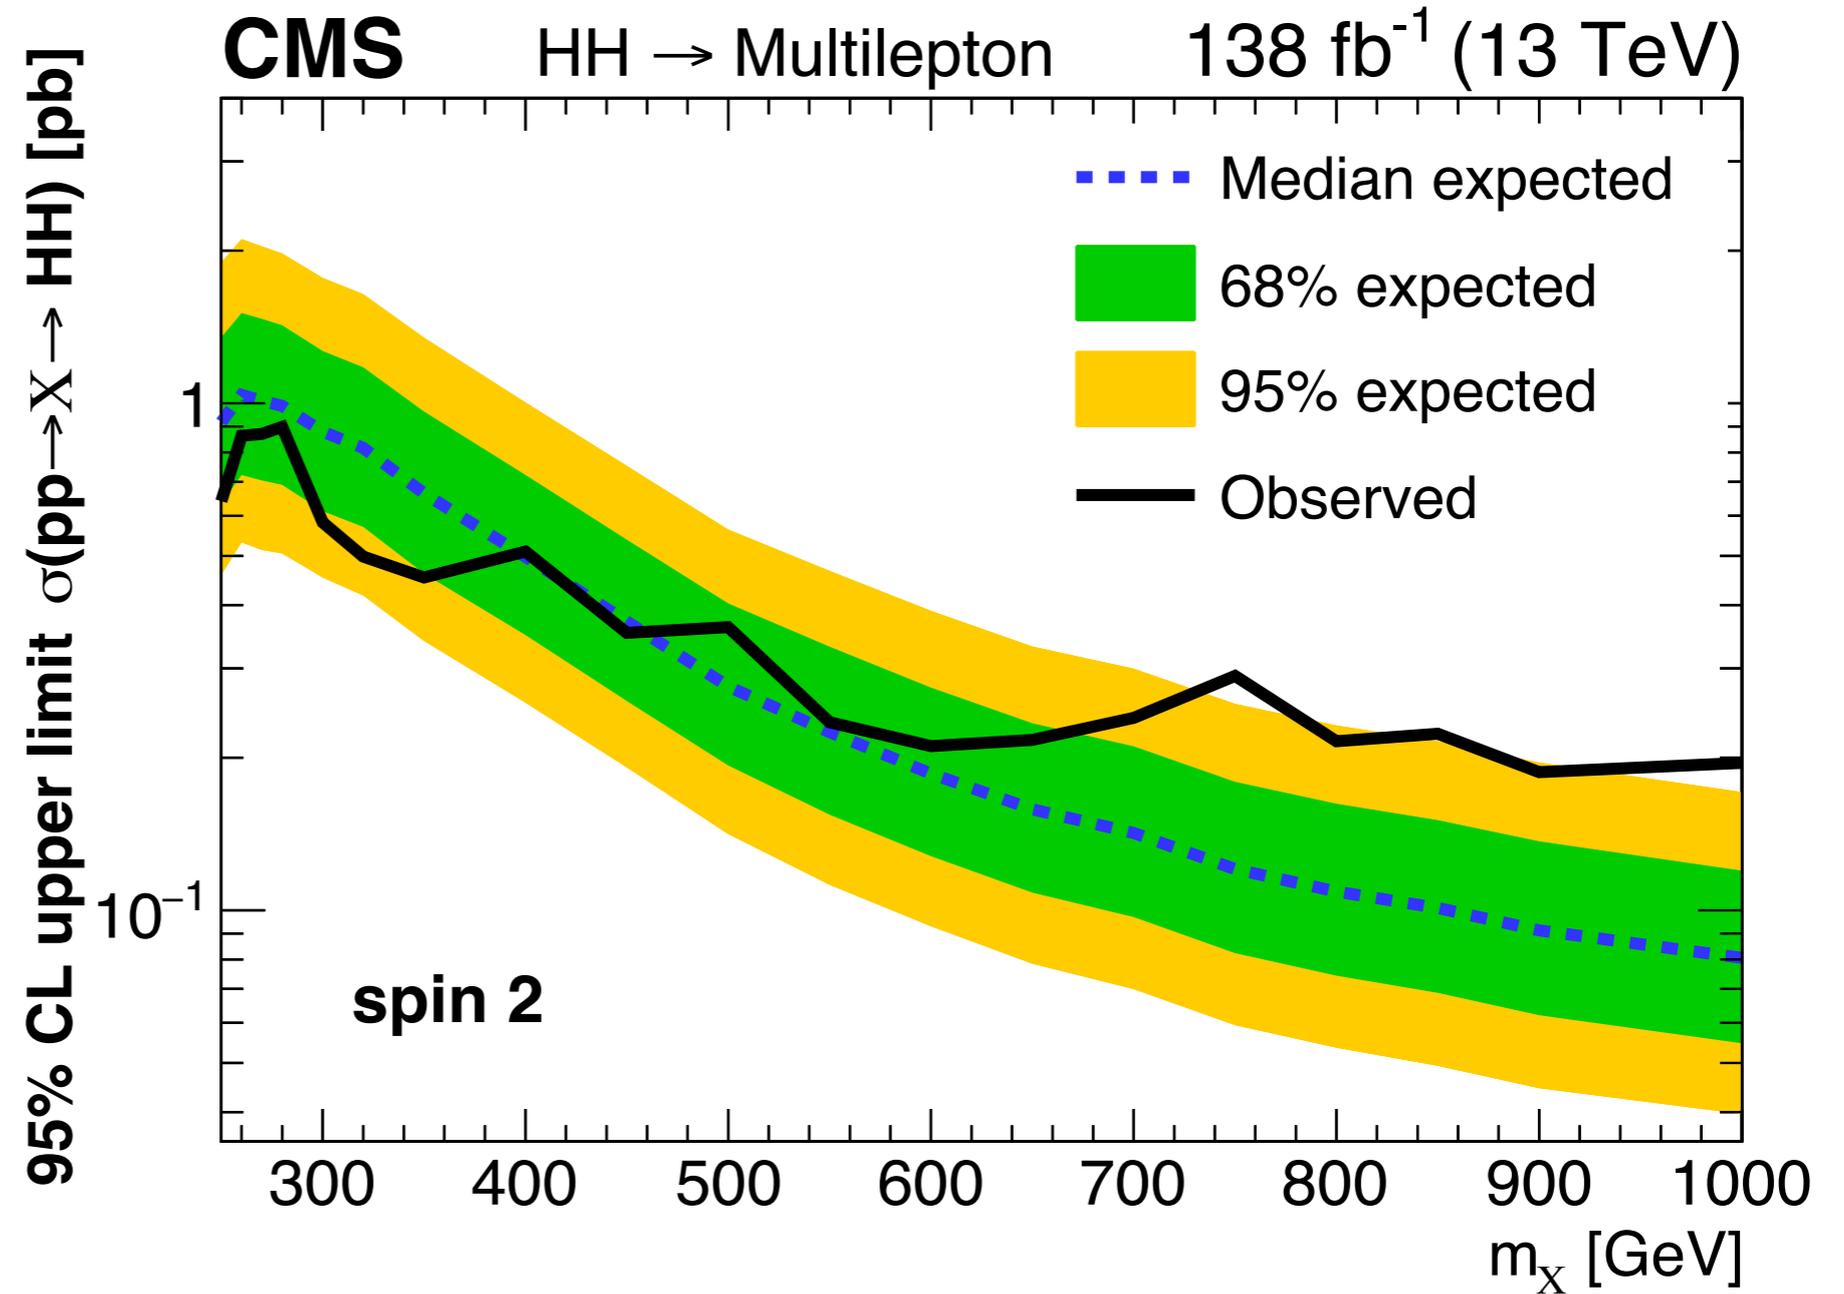

- H → hh → multilepton analysis left plot shows discriminating variable for 2ℓss category
- Also show limits split by channels (right) for spin 0 resonance

[HIG-21-002](#)

# H → hh → multilepton: spin 2

- Limits for spin 2 resonance

[HIG-21-002](#)

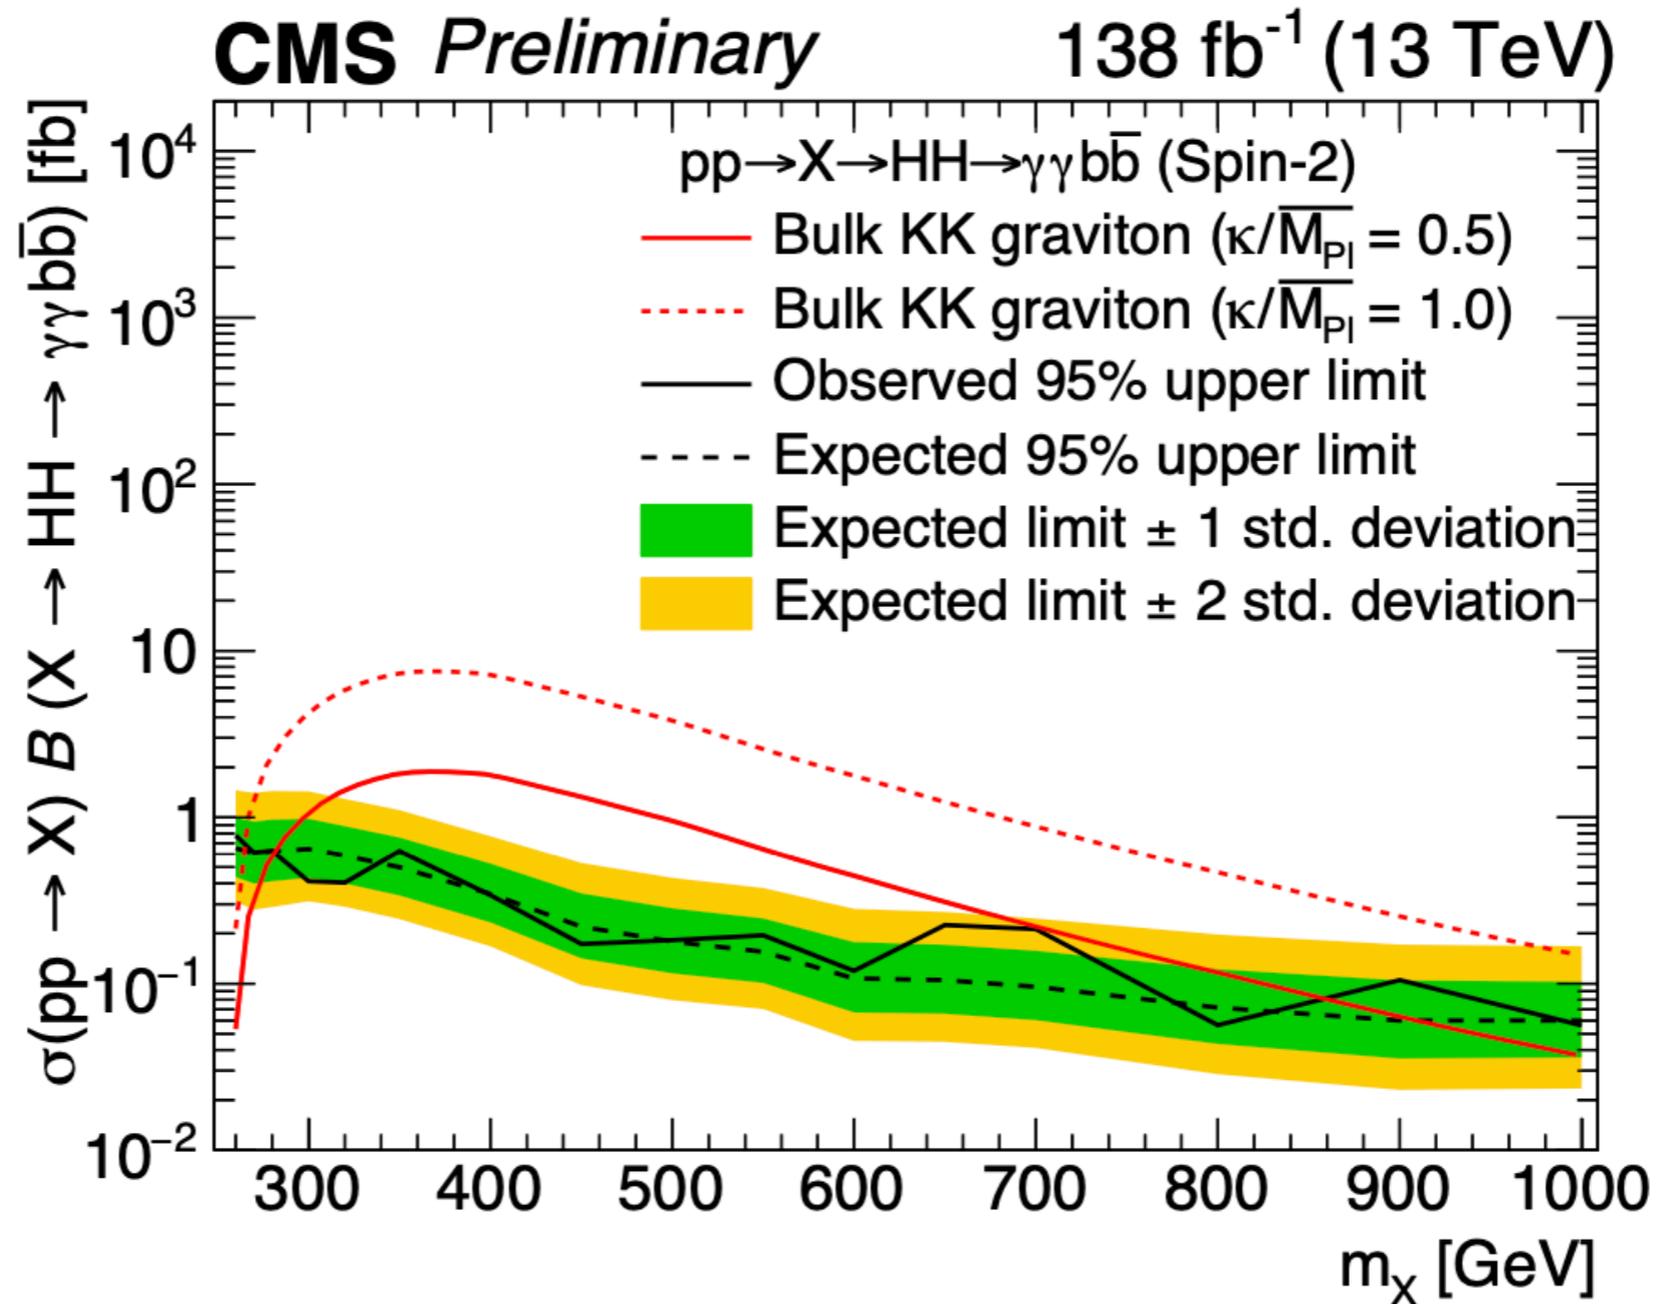

# H → hh → multilepton: BDT variables

- BDT variables include:
  - $p_T$  and  $\eta$  of the l and  $\tau_h$  candidates
  - Angular separation between the l and  $\tau_h$
  - Angular separation between the l or  $\tau_h$  and the nearest jet
  - The jet multiplicity and the missing  $p_T$
  - The scalar  $p_T$  sum of the l and  $\tau_h$  and the jets
  - Mass estimates for the H boson pair
- Trained on all mass MC samples
- Mass is used as a real-values input to the BDT

[HIG-21-002](#)

# $H \rightarrow hh \rightarrow bb\gamma\gamma$ : spin 2

- Limits set for spin 2 hypothesis

[HIG-21-011](#)

# $H \rightarrow hh(Y) \rightarrow bb\gamma\gamma$ : BDT variables

- BDT used to reject non-resonant background. Variables include:
- Kinematic variables:
  - Helicity angles
  - Angular distance between photons and jets
  - $p_T$ /mass for photons and jets
- Object ID variables:
  - Leading and subleading photon ID
  - Leading and subleading b-jet tagging discriminant
- Resolution variables:
  - Energy resolution of photons and mass resolution of di-photons
  - Energy resolution of jets and mass resolution of di-jets

[HIG-21-011](#)

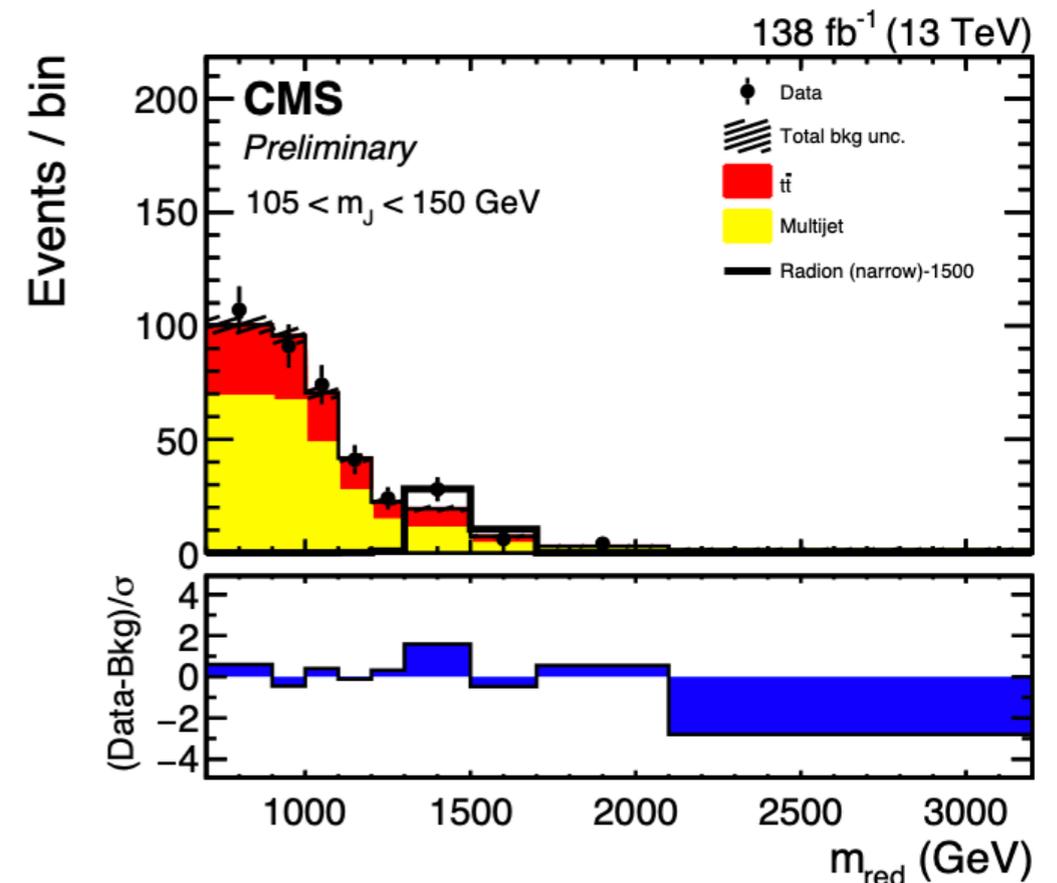

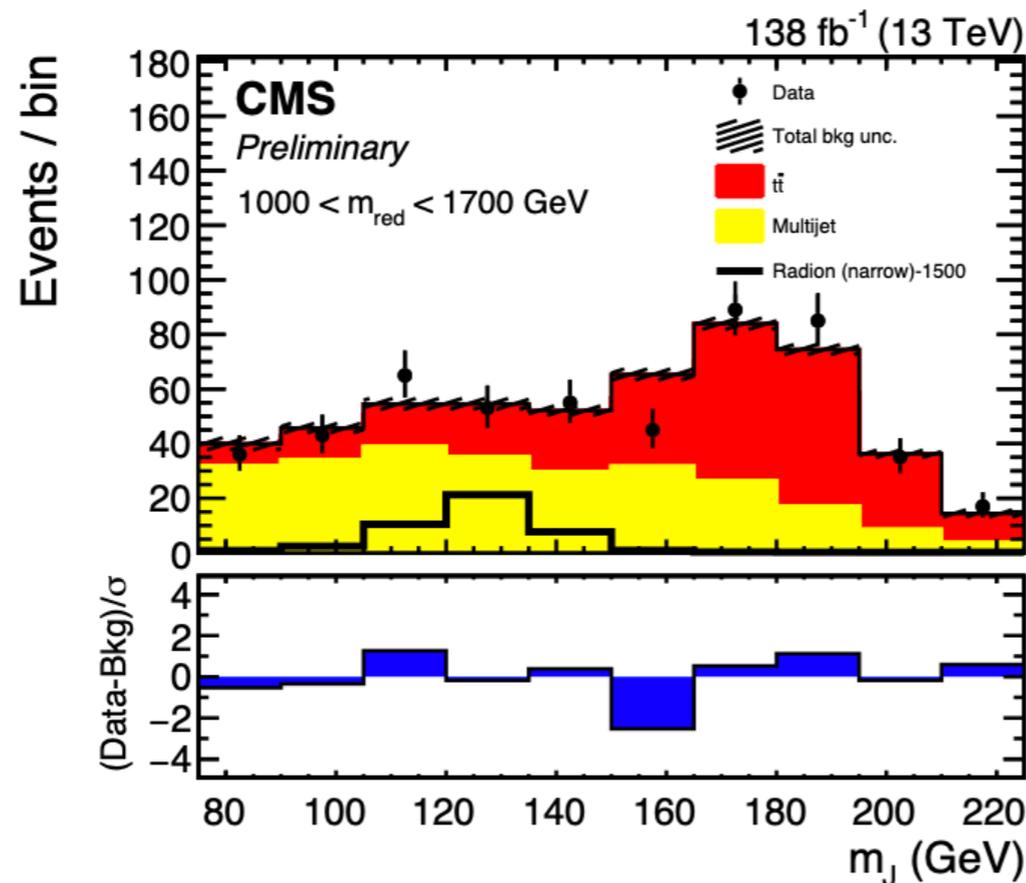

# $H \rightarrow hh(\Upsilon) \rightarrow bb\gamma\gamma$ : 2D fit

- Results are extracted by performing unbinned maximum likelihood 2D fit of  $m_{\gamma\gamma}$  vs  $m_{jj}$
- Signal is modelled by fitting events with a product of two parametric signal models
  - Sum of gaussians for  $m_{\gamma\gamma}$  (up to 5 gaussians)
  - A double sided crystal ball (CB) or sum of CB and a Gaussian for  $m_{jj}$
- Correlations between  $m_{\gamma\gamma}$  vs  $m_{jj}$  found to be negligible from simulations
- For single Higgs background:
  - $m_{\gamma\gamma}$  modelled as before
  - $m_{jj}$  parameterisation depends on production mode e.g for ttH a Gaussian with mean around 120 GeV is used
- Non-resonant background used discrete profiling method is used to fit background  $m_{\gamma\gamma}$  and  $m_{jj}$  distributions

[HIG-21-011](#)

# H → hh → bbbb

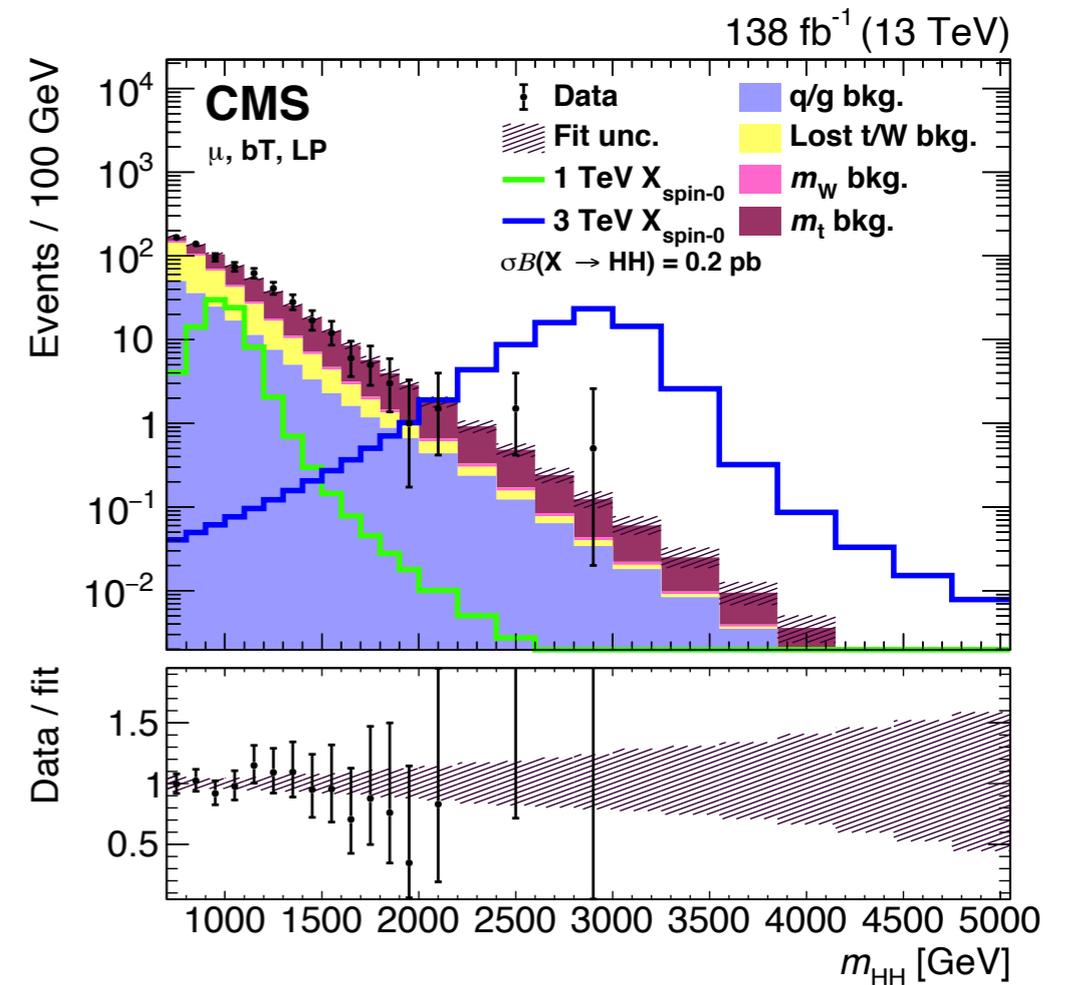

- Search for boosted bbbb final state
- At least 1 H decay candidate is boosted so 2b's end up in 1 large R jet (AK8)
- DNN based tagger used to select such 2b jets
- Discriminating variables constructed using soft drop masses
- 2D discriminating variable  $m_J$  (mass of leading AK8 jet) and “reduced mass”  $m_{\text{red}}$

[B2G-20-004](#)

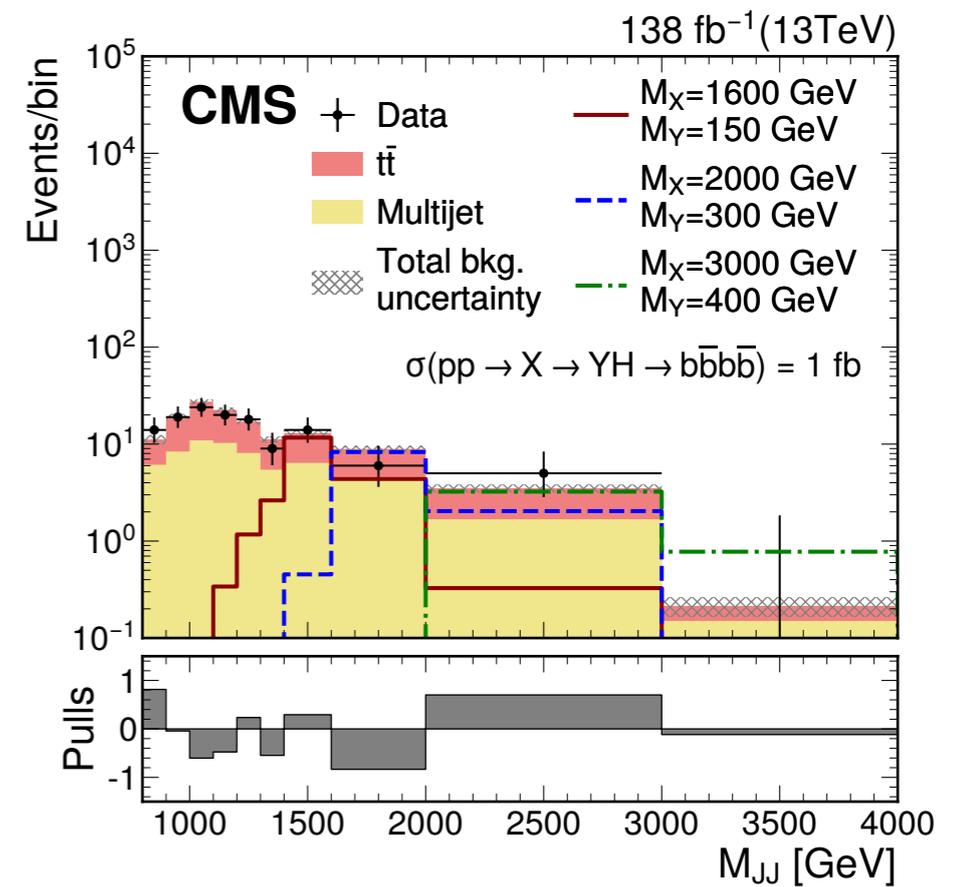

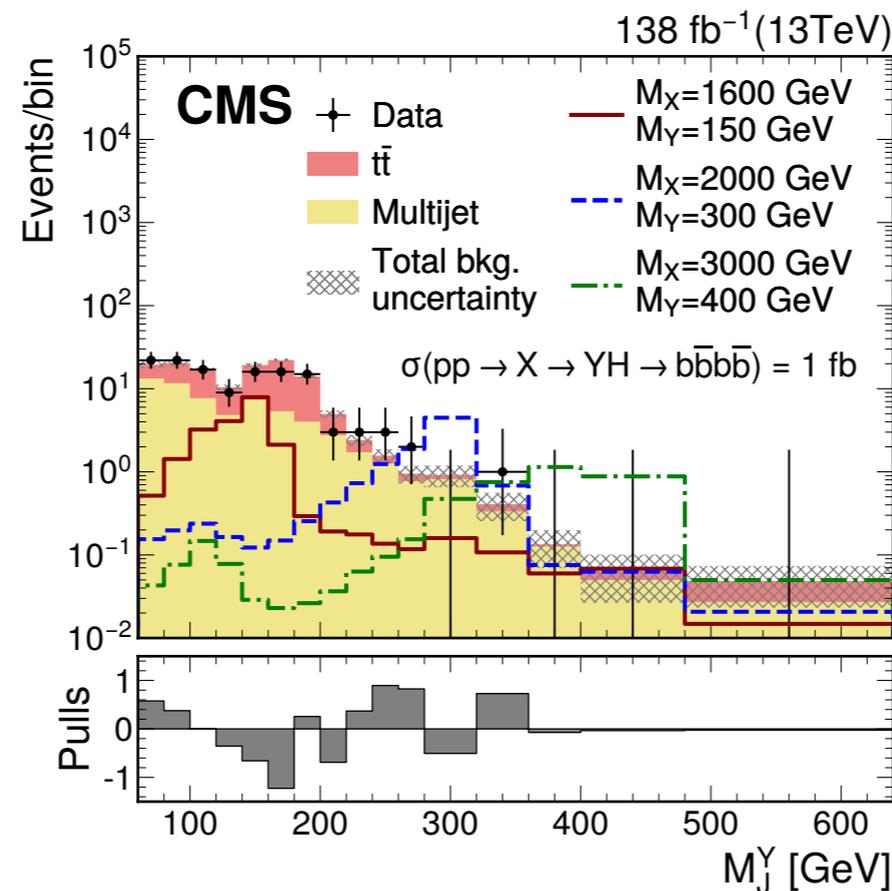

# $H \rightarrow hh \rightarrow bbWW$

- Search for  $bbWW$  final state
- $WW$  pair decays to 1 or 2 leptons
- Signal also includes contribution from  $h \rightarrow \tau\tau \rightarrow l\nu l\nu$
- 2b's merged into single AK8 jet - identified using DNN
- $W \rightarrow qq$  decays also merged into AK8 jets

# $X \rightarrow Yh \rightarrow b\bar{b}b\bar{b}$ (boosted)

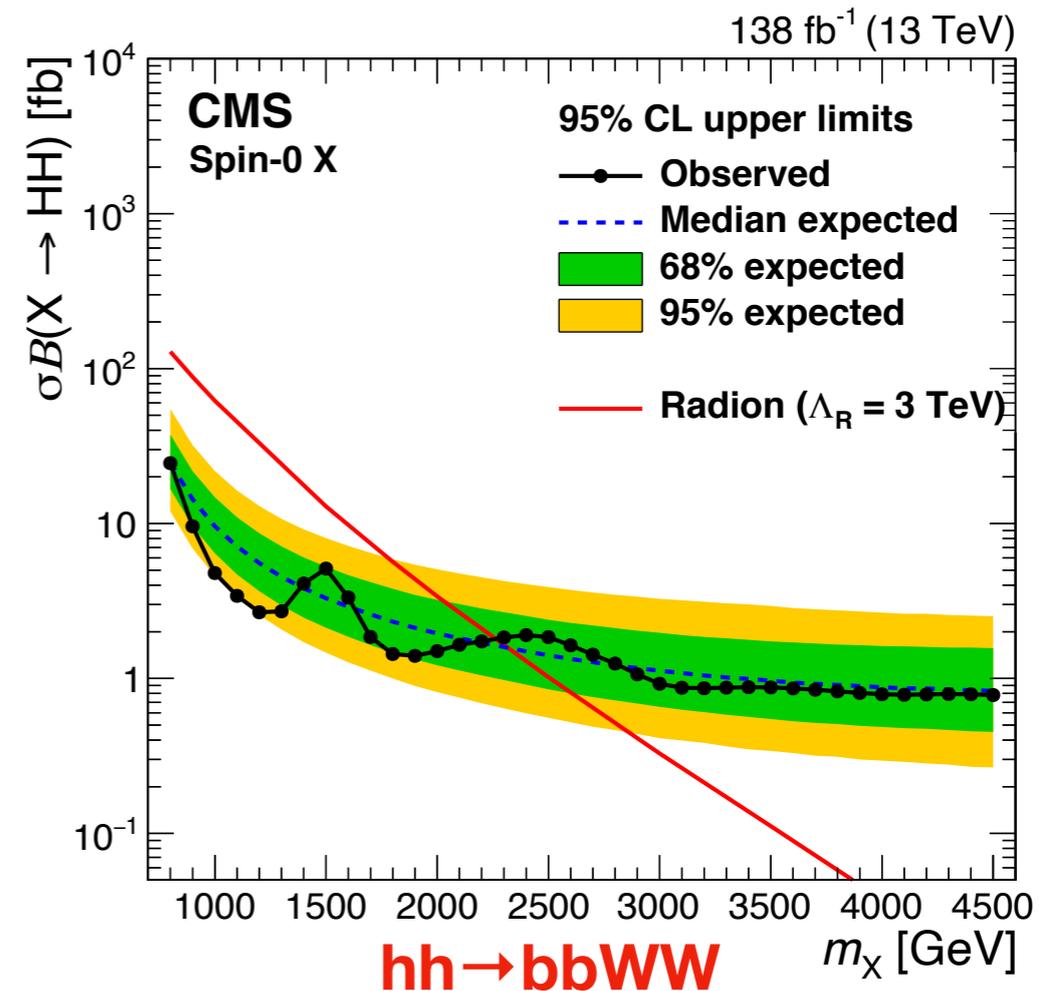

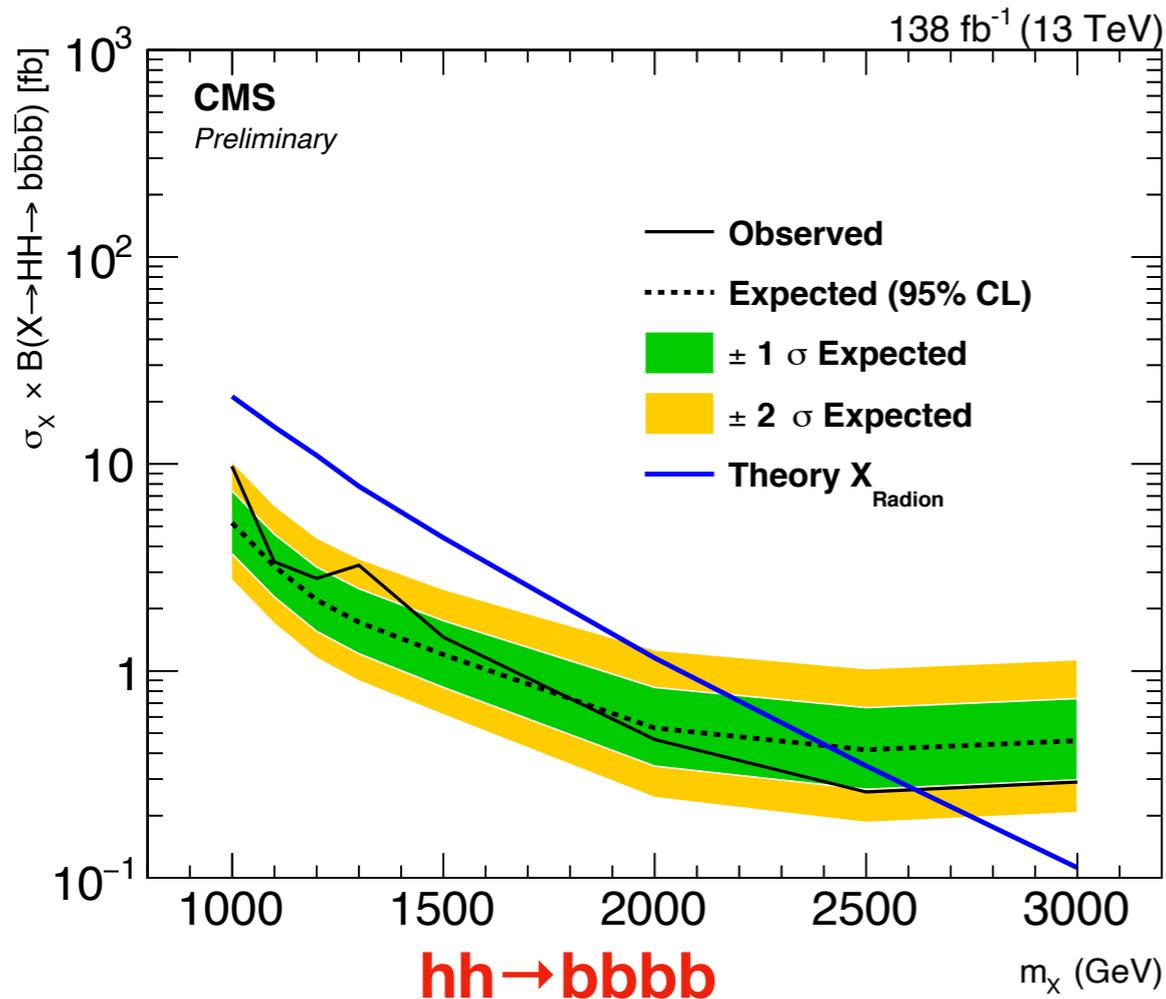

- Each  $b\bar{b}$  pair reconstructed at large R jet (AK8)
- ParticleNet algorithm used to identify  $b\bar{b}$  jets
- One jet required to have mass consistent with 125 GeV
- 2D fit of  $m_X$  and  $m_Y$  reconstructed masses

[B2G-21-003](#)

# H → hh → bb + bb/WW

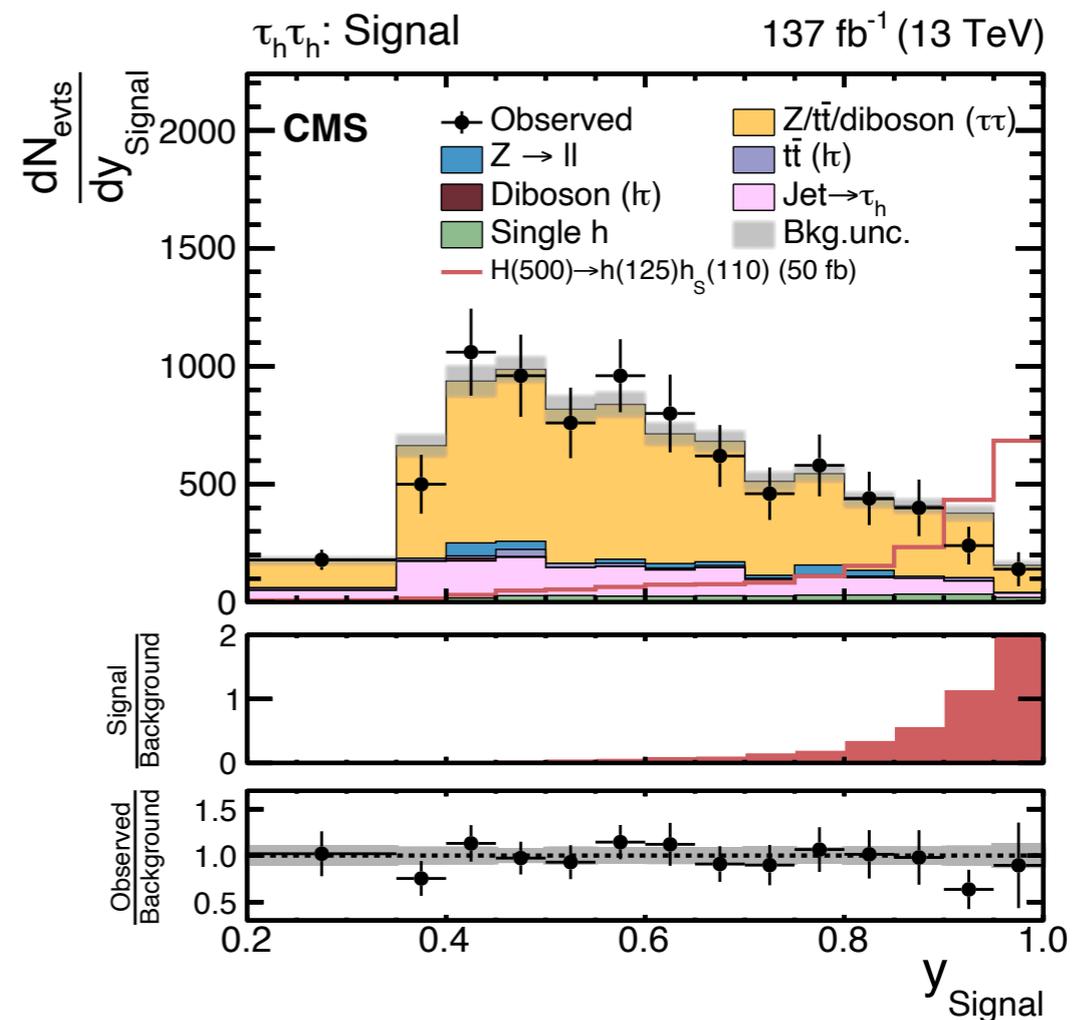

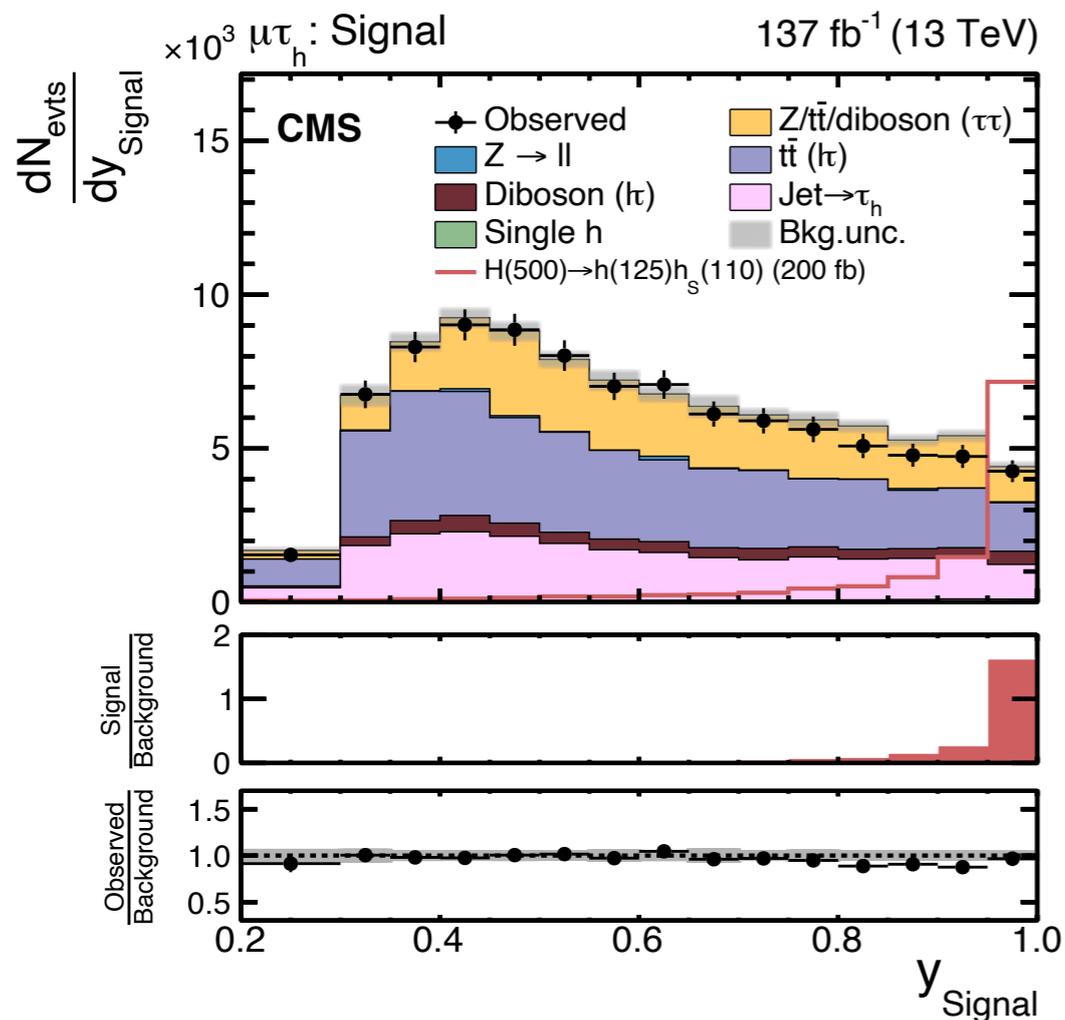

- CMS has also searched for boosted bbbb final state and boosted/semi-resolved bbWW
- No significant excesses observed, so limits set of cross-sections

[B2G-20-004](#)

[B2G-20-007](#)

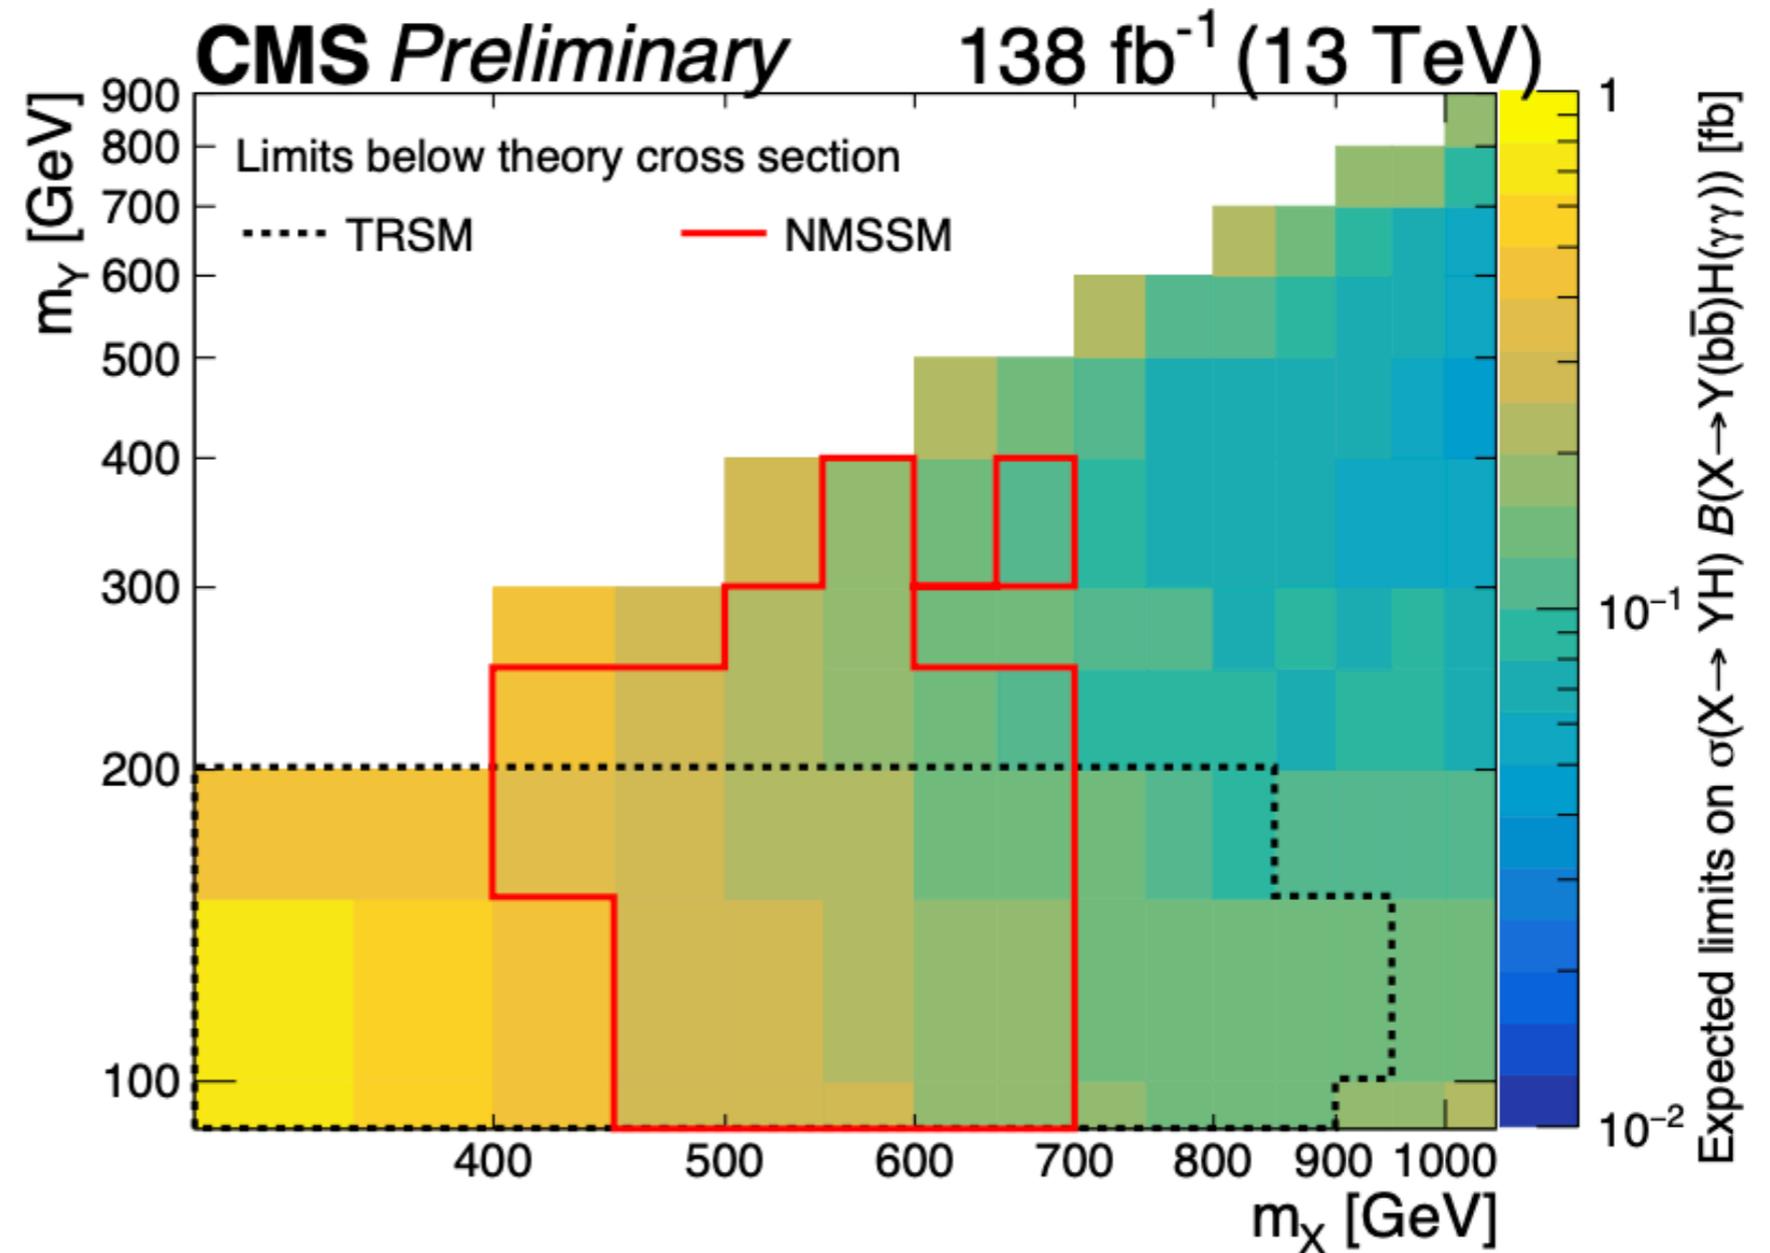

- Target events with  $\tau_h\tau_h$ ,  $\mu\tau_h$ ,  $e\tau_h$  candidates and 2 jets (at least 1 is b-tagged)
- Use NN to separate signal from backgrounds

- Use NN to separate signal from backgrounds, using variables:
- $p_T$  of  $\tau$  candidates and b-jets
- Mass and  $p_T$  estimates of the  $\tau\tau$  pair, the bb pair, and the  $bb\tau\tau$  system
- $N_{\text{bjets}}$  and kinematic properties of the jets
- Output scores of the b-tagger classifier
- Separate NNs trained for different mass regions

# $H \rightarrow Yh \rightarrow bb\gamma\gamma$

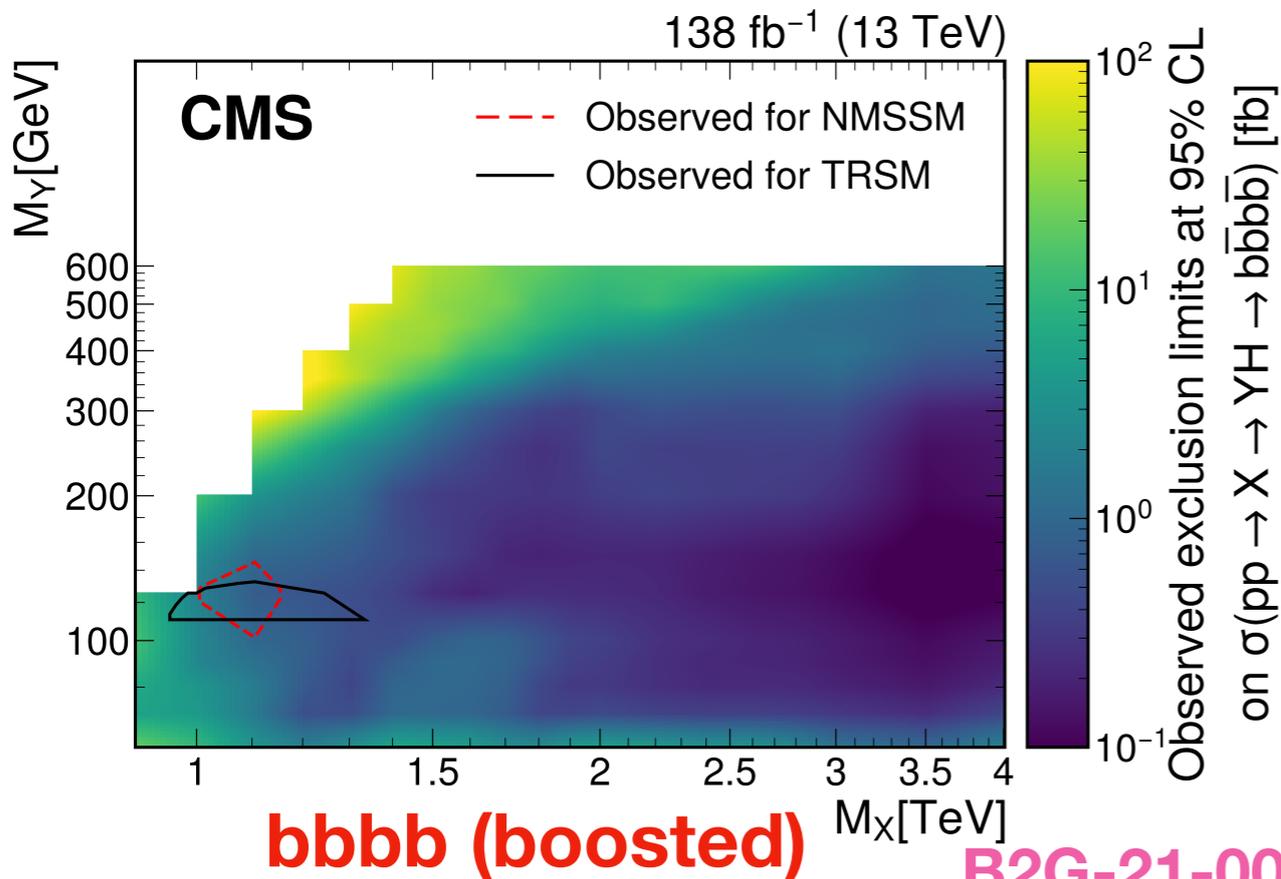

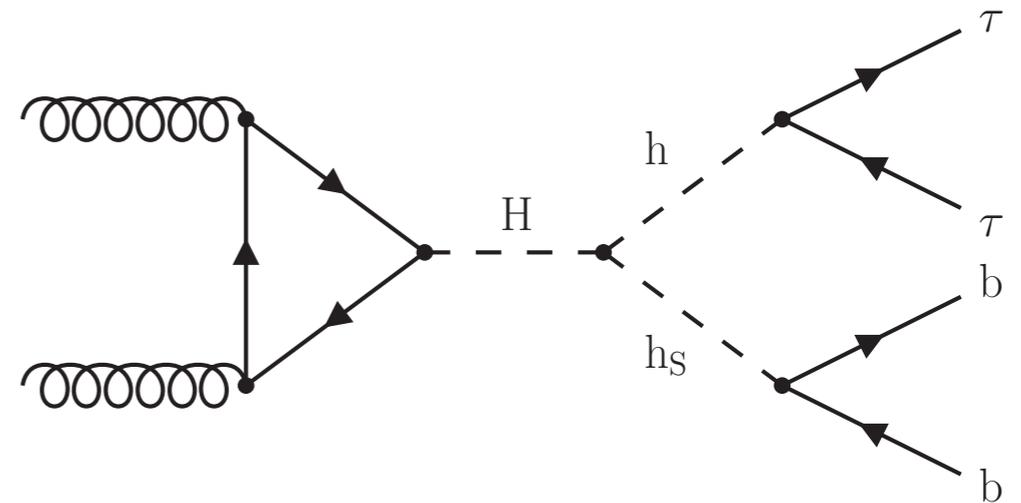

- Comparison of observed limits to most optimistic cross sections for TRSM and NMSSM

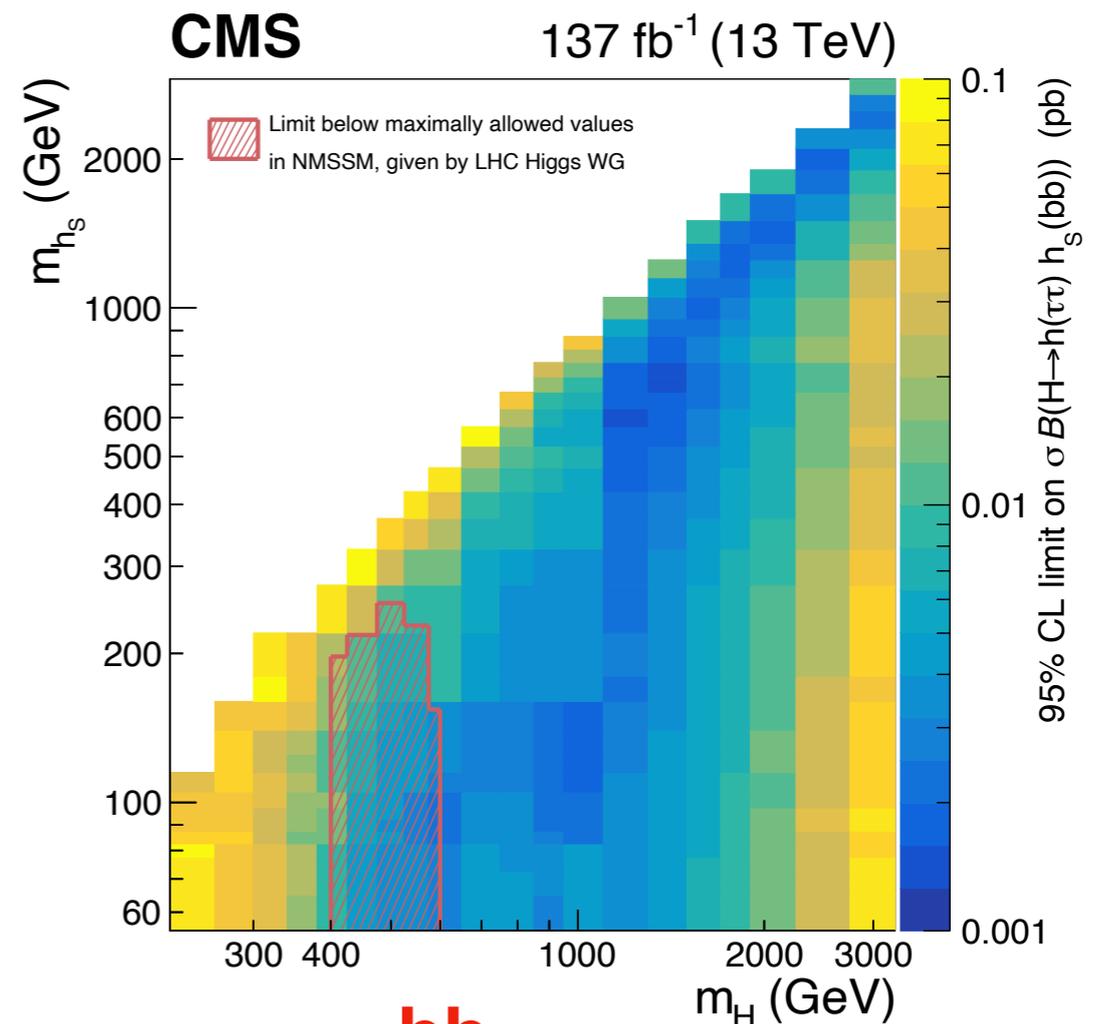

[HIG-21-011](#)

# $X \rightarrow Yh$

- Searched for  $X \rightarrow Yh$  well motivated in models such as NMSSM
  - H decays to  $h(125)$  and singlet-like scalar ( $h_s$ )
- CMS have searched  $4b$  (boosted) and  $bb\tau\tau$  final states

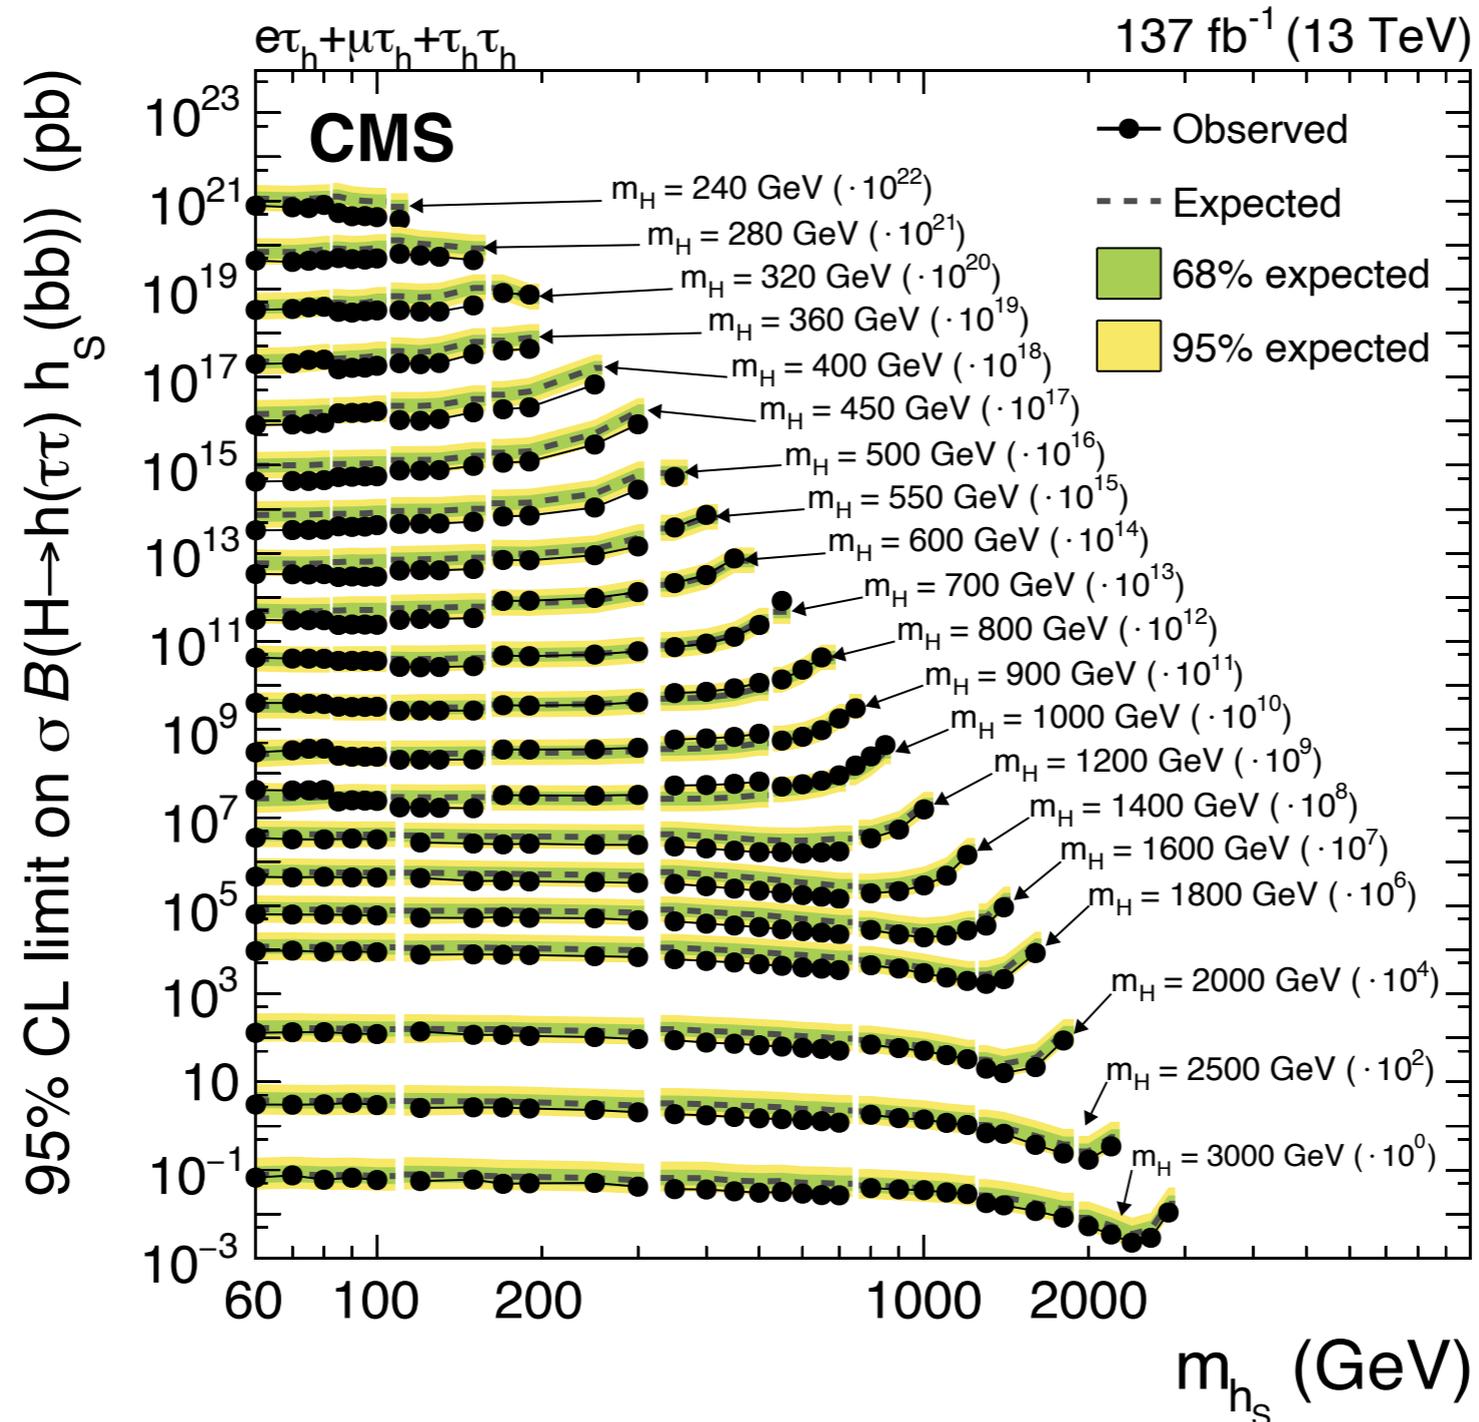

[B2G-21-003](#)

[HIG-20-014](#)

- Limits on cross section times branching ratio for  $bb\tau\tau$  final state

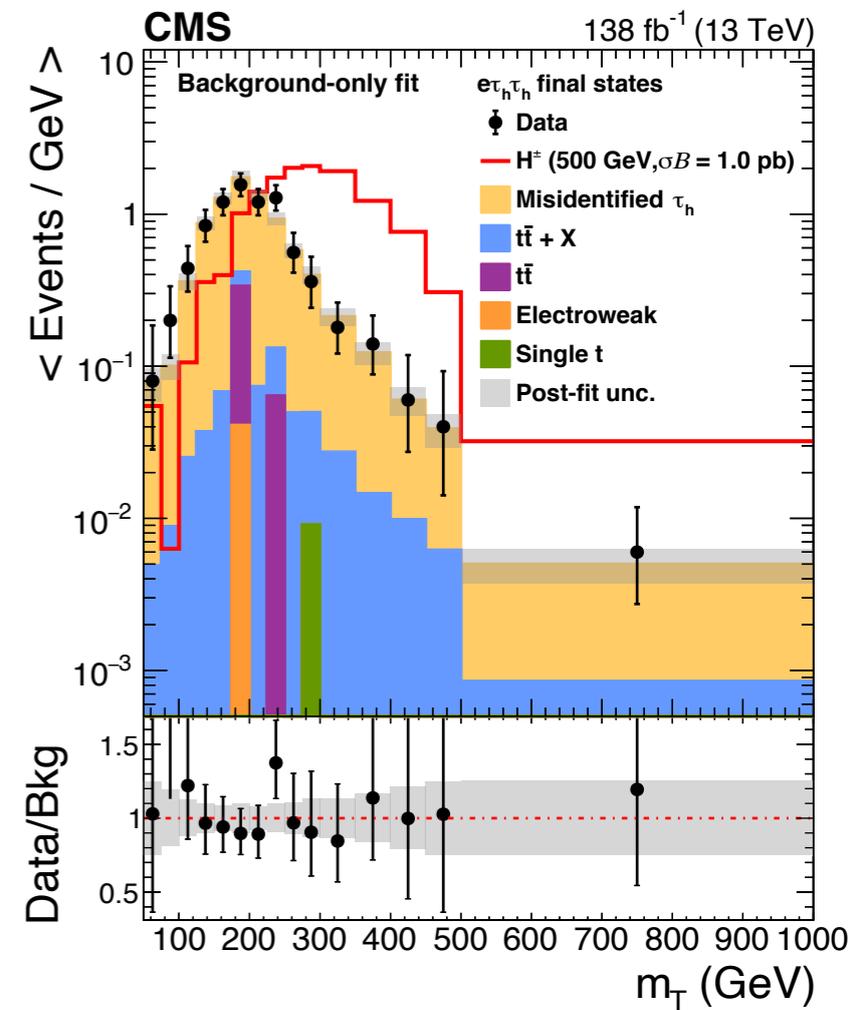

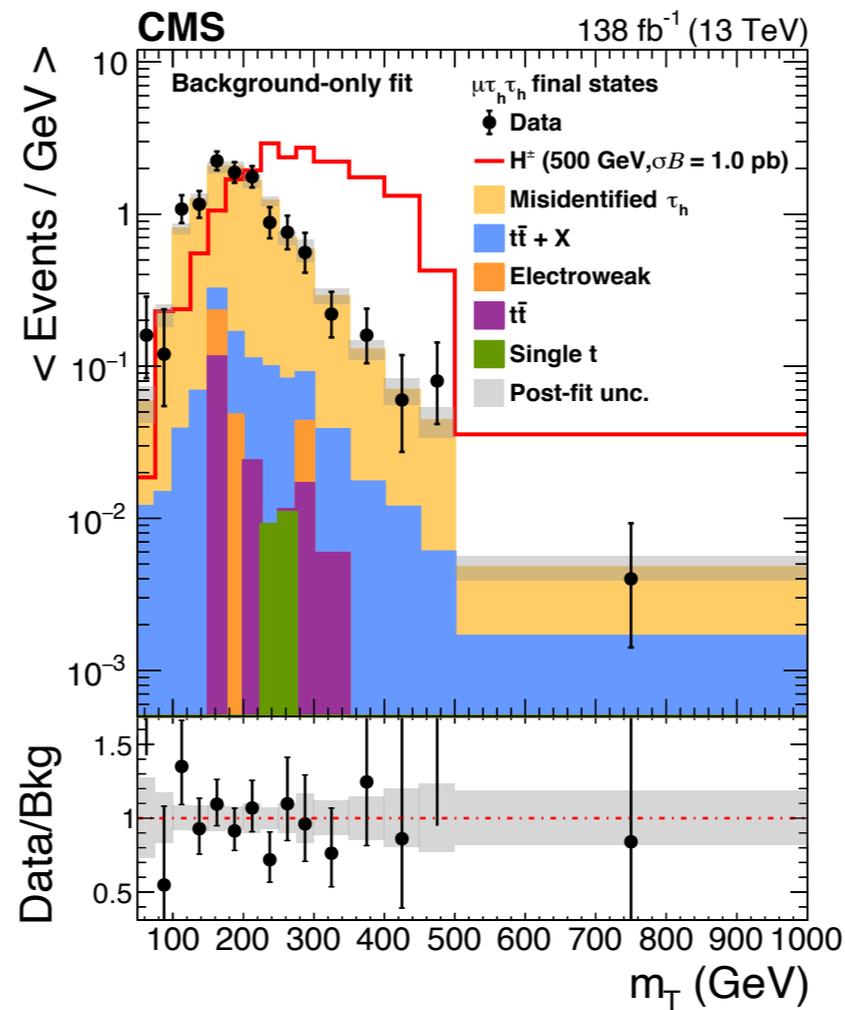

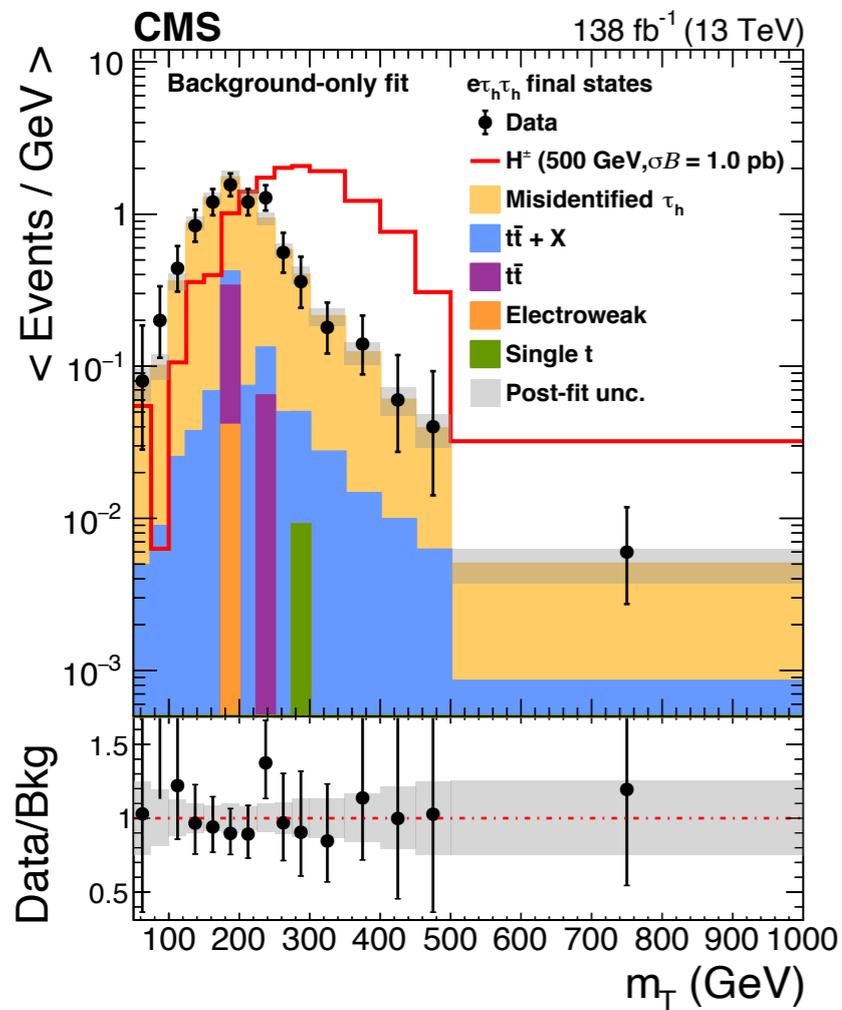

[HIG-20-014](#)

- BDT used to separate signal from background in lτ<sub>h</sub> channels
- Separate trainings for different mass hypotheses

Variable	Description
$\Delta\phi(\tau_h, \vec{p}_T^{\text{miss}})$	azimuthal angle between the $\tau_h$ and $\vec{p}_T^{\text{miss}}$ objects
$\Delta\phi(\ell, \vec{p}_T^{\text{miss}})$	azimuthal angle between the $\ell$ and $\vec{p}_T^{\text{miss}}$ objects
$\frac{p_T^{j_1 j_2} - p_T^{H^\pm}}{p_T^{j_1 j_2} + p_T^{H^\pm}}$	ratio of $p_T$ sums calculated from $\ell, \tau_h, j_1, j_2$ and $\vec{p}_T^{\text{miss}}$
$\frac{p_T^{j_1 j_2}}{H_T}$	ratio of $p_T$ of the first two leading jets and the $H_T$
$m_T(\ell, \tau_h, j_1, j_2, \vec{p}_T^{\text{miss}})$	$m_T$ reconstructed from $\ell, \tau_h, j_1, j_2,$ and $\vec{p}_T^{\text{miss}}$
$\frac{p_T^{j_3}}{H_T}$	ratio of the $p_T$ of the third leading jet and the $H_T$
$m(\ell, \tau_h)$	invariant mass of the $\ell$ and $\tau_h$ objects
$\frac{p_T^{j_1 j_2} + L_T}{H_T}$	ratio of $p_T$ of first two leading jets plus $L_T$ and the $H_T$
$m_T(\ell, \vec{p}_T^{\text{miss}})$	$m_T$ reconstructed from the $\ell$ and $\vec{p}_T^{\text{miss}}$ objects
$p_T^{\tau_h}$	transverse momentum of $\tau_h$ object
$N_{\text{jets}}$	number of selected jets in the event
$N_{\text{t}^{\text{res}}}$	number of selected $\text{t}^{\text{res}}$ objects in the event

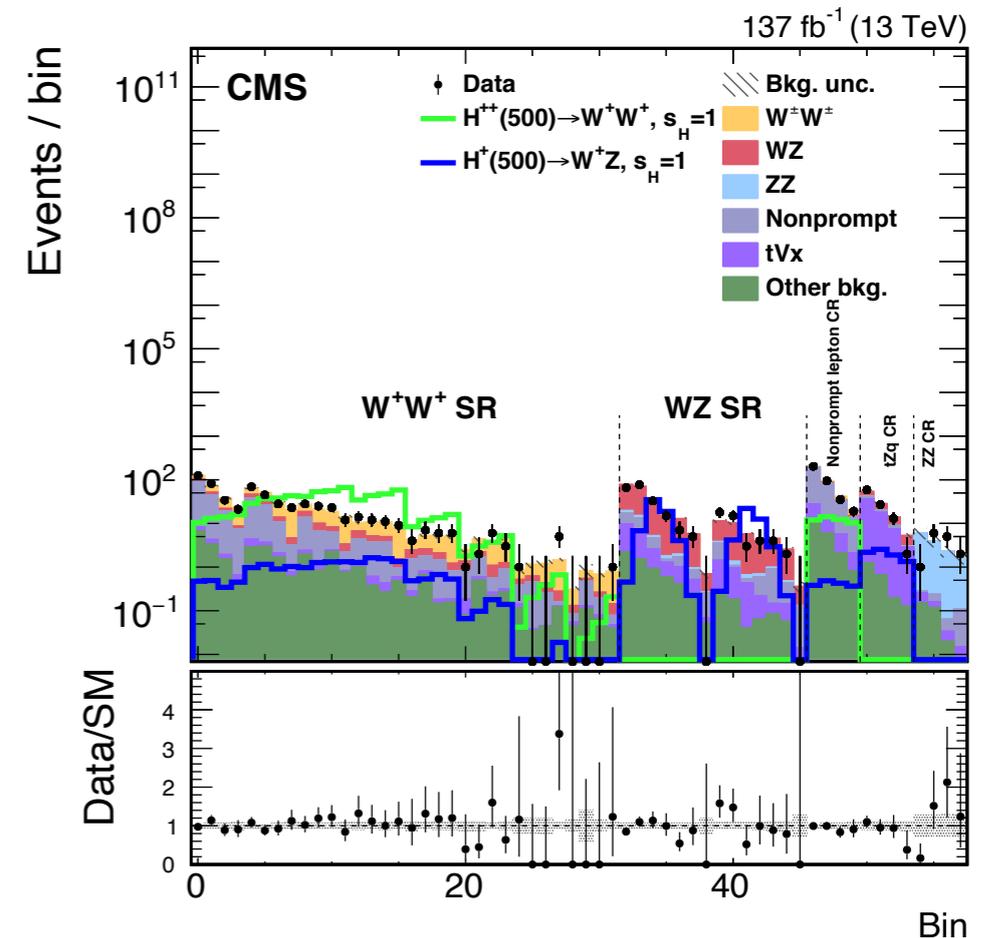

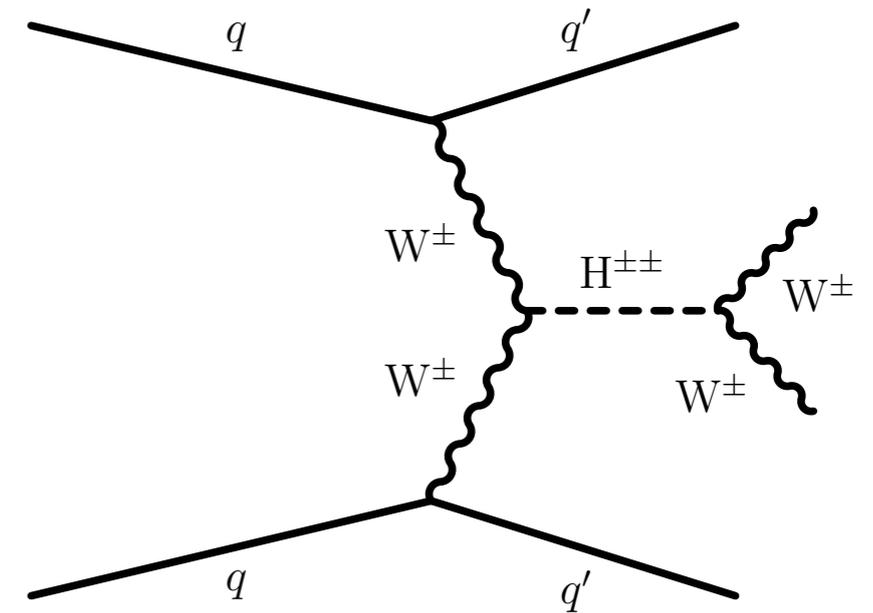

# $H^\pm \rightarrow WH, H \rightarrow \tau\tau$ : Other fitted distributions

HIG-21-010

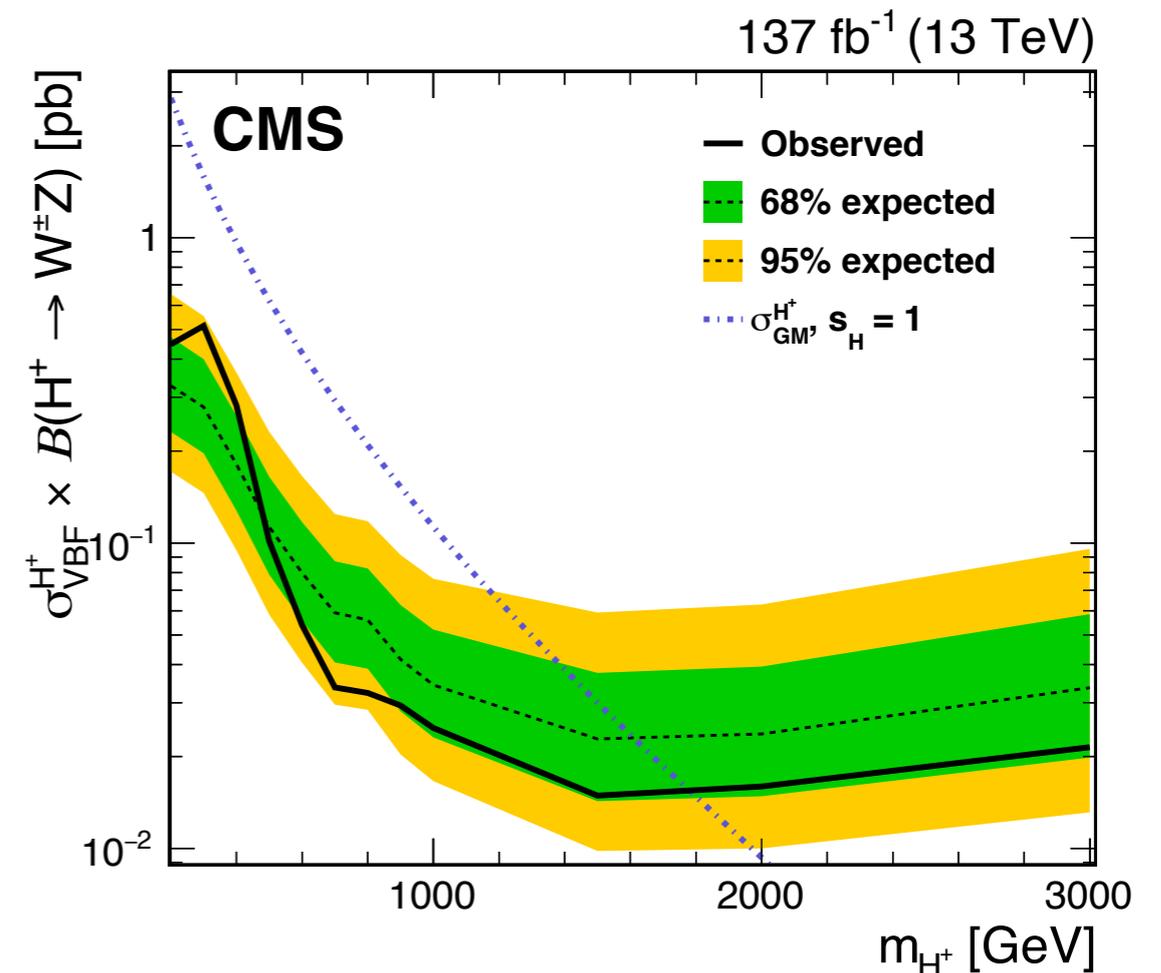

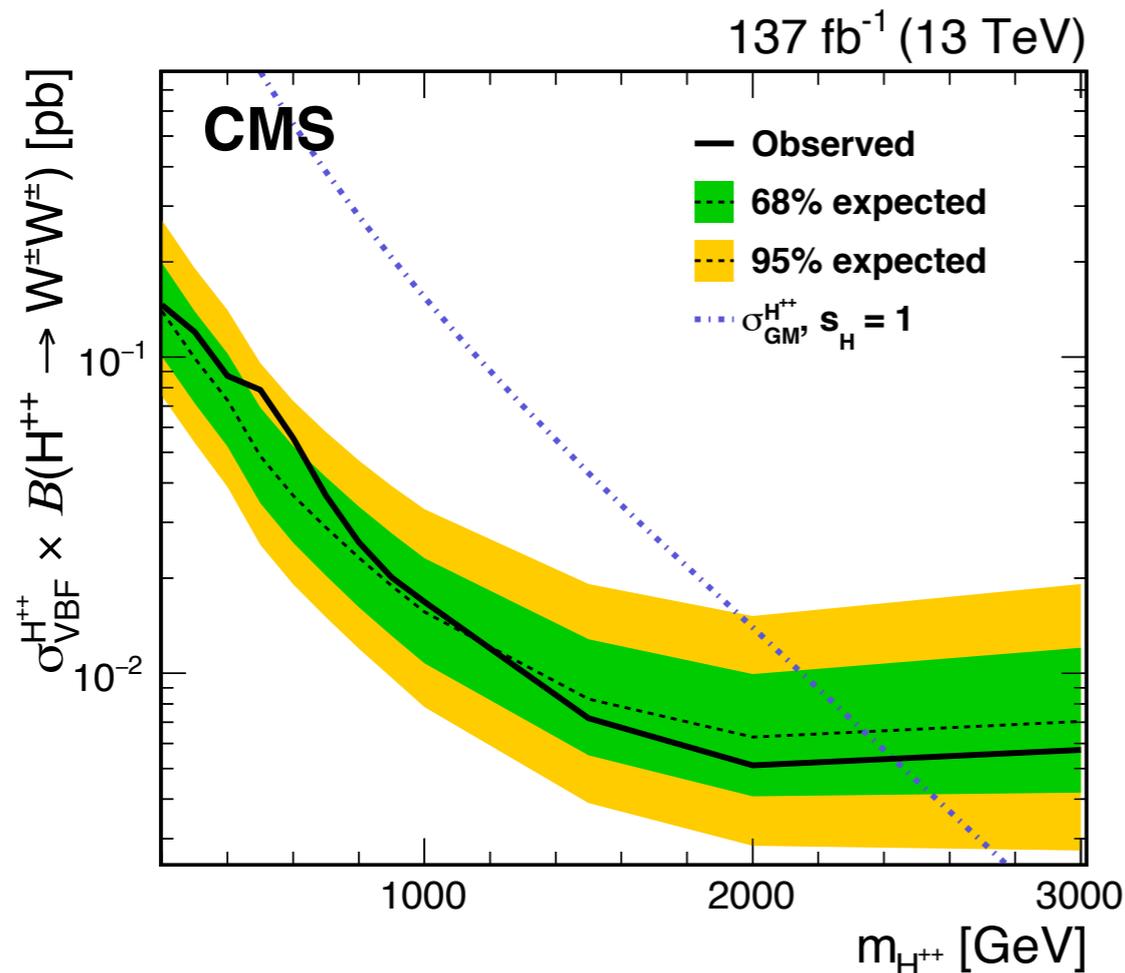

# $H^{\pm(\pm)} \rightarrow WZ$ (WW)

- Search for  $H^{\pm(\pm)}$  in WZ or WW final states produced by VBF
- Select events with 2 jets to tag VBF
- 2 or 3 leptons required in final states + missing  $p_T$
- Fit 2D distribution  $m_{jj}$  vs  $m_T$  to extract results
- Motivated by models with additional SU(2) triplets
  - Get singly and doubly charged Higgs' that couple to W and Z bosons at tree level
  - e.g Georgi–Machacek model

# $H^{\pm(\pm)} \rightarrow WZ (W^{\pm}W^{\pm})$

- CMS has also searched for charged and doubly charged Higgs in  $WZ$  and  $W^{\pm}W^{\pm}$  final state
- Production process is VBF
- No excess observed, limits set on cross-sections

[HIG-20-017](#)

# Low mass $H \rightarrow \gamma\gamma$ analysis

- Analysis performed using only Run 1 (19.7 fb<sup>-1</sup>) and Run 2 data collected in 2016 (35.9 fb<sup>-1</sup>)
- Excess with local (global) significance of 2.8 (1.3) $\sigma$  @ 95.3 GeV
