Models with extended scalar sectors

Constraints

- **Theory**

  minimization of vacuum (tadpole equations), vacuum stability, positivity, perturbative unitarity, perturbativity of couplings

- **Experiment**

  provide viable candidate @ 125 GeV (coupling strength/ width/ ...);
  agree with null-results from additional searches and ew gauge boson measurements (widths);
  agree with electroweak precision tests (typically via S,T,U);
  agree with astrophysical observations (if feasible)

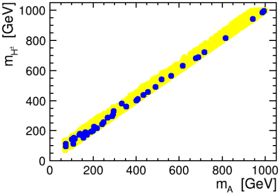
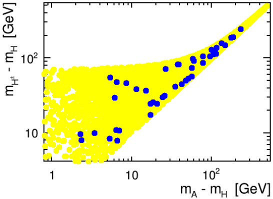
IDM benchmark points

Out of about 15'000 points consistent with all considered constraints, we chose 43 benchmark points (23 accessible at 380 GeV) for detailed studies:





The selection was arbitrary, but we tried to

- cover wide range of scalar masses and the mass splittings
- get significant contribution to the relic density

Signatures at e^+e^- colliders

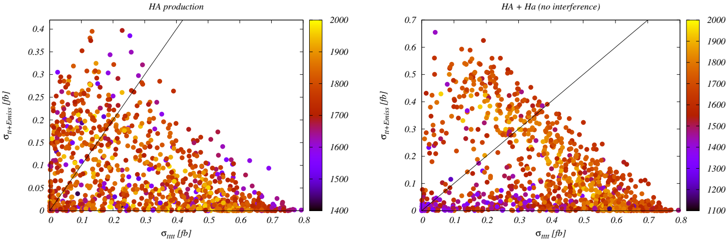
a priori: as standard THDM

- new feature: **new scalar a; mixing: both a/A can decay invisibly**
- interesting channels: ha, hA, Ha, HA
- mass ranges: between $200\,\mathrm{GeV}$ and $2\,\mathrm{TeV}$
- most promising: HA, Ha **at 3 TeV**

$\Rightarrow$ **cross sections up to 1 fb**

$\Rightarrow$ **dominant final states:** $t\,\bar{t}\,t\,\bar{t}$; $t\bar{t} + \not{E}$

Can the $\not{E}$ channel ever be dominant ?



$t\bar{t}t\bar{t}$ and $t\,\bar{t} + \not{E}$ final states ...including Ha channel

[color coding $m_A + m_H$] [color coding $0.5 \times (m_a + m_A) + m_H$]

bottom line: **can find regions where $t\bar{t} + \not{E}$ dominates**

Summary

- presented **2 models that lead to SM + $\not{E}$ final states** at lepton colliders
- final states: **ew gauge bosons + $\not{E}$/ $t\bar{t} + \not{E}$**
- **most studies here for $\sim 1\,\mathrm{TeV}$ com energies**

$\mu^+\mu^-$ colliders

currently under discussion, early stages

Special role of the scalar sector

- **Higgs potential in the SM**

$$\mathbf{V} = -\mu^2\,\mathbf{\Phi}^\dagger\,\mathbf{\Phi} + \lambda\,\left(\mathbf{\Phi}^\dagger\,\mathbf{\Phi}\right)^2, \quad \mathbf{\Phi} = \frac{1}{\sqrt{2}}\begin{pmatrix} 0 \\ \mathbf{v} + \mathbf{h(x)} \end{pmatrix}$$

$\Rightarrow$ **mass** for Higgs Boson and Gauge Bosons

$$\mathbf{m_h^2} = 2\,\lambda\,\mathbf{v}^2,\ \mathbf{m_W} = \mathbf{g}\,\frac{\mathbf{v}}{2},\ \mathbf{m_Z} = \sqrt{\mathbf{g}^2 + (\mathbf{g}')^2}\,\frac{\mathbf{v}}{2}$$

where v: Vacuum expectation value of the Higgs field, g, g'': couplings in $SU(2) \times U(1)$

$\Rightarrow$ **everything determined in terms of gauge couplings, v, and λ**

**form of potential determines minimum,

$\Rightarrow$ stability of the Universe, electroweak phase transition, etc

- **full test requires checks of *hhh*, *hhhh* couplings**

$\Rightarrow$ **so far: only limits; possible only at future machines** [HL-LHC: constraints on *hhhh*]

Other possible extensions

- A priori: **no limit to extend scalar sector**
- **make sure you**
  - have a **suitable ew breaking mechanism**, including a **Higgs candidate at** $\sim 125\,\mathrm{GeV}$
  - can explain **current measurements**
  - are **not excluded by current searches** and precision observables
- **nice add ons:**
  - can **push vacuum breakdown to higher scales**
  - can **explain additional features**, e.g. dark matter, or hierarchies in quark mass sector
  - ...
- Multitude of models out there
- adding ew gauge singlets/ doublets/ triplets...

$$\mathbf{v},\ \mathbf{M_h},\ \mathbf{M_H},\ \mathbf{M_A},\ \mathbf{M_{H^\pm}},\ \lambda_2,\ \lambda_{345}\,[=\lambda_3+\lambda_4+\lambda_5]$$

- v, M_h fixed $\Rightarrow$ left with **5 free parameters**

Constraints: Theory

- **vacuum stability, positivity, constraints to be in inert vacuum**
- **perturbative unitarity, perturbativity of couplings**
- **choosing** M_H as dark matter: $M_H \leq M_A,\ M_{H^\pm}$

Constraints: Experiment

$$M_h = 125.1\,\mathrm{GeV},\; v = 246\,\mathrm{GeV}$$

Analysis strategy

Lepton pair production can be a signature of the AH production process followed by the A decay:

$$e^+e^- \rightarrow HA \rightarrow HHZ^{(\star)} \rightarrow HH\mu^+\mu^-$$

while the production of the different flavour lepton pair is the expected signature for H^+H^- production:

$$e^+e^- \rightarrow H^+H^- \rightarrow HHW^{+(*)}W^{-(*)} \rightarrow HH\ell^+\ell'^-\nu\bar{\nu}'$$

We consider two possible final state signatures:

- moun pair production, $\mu^+\mu^-$, for AH production
- electron-muon pair production, μ^+e^- or $e^+\mu^-$, for H^+H^- production

Both channels include contributions from AH and H^+H^- production!
In particular due to leptonic tau decays.

Signal and background samples were generator with WHizard 2.2.8
based on the dedicated IDM model implementation in SARAH,
parameter files for benchmark scenarios were prepared using SPheno 4.0.3

CLIC luminosity spectra taken into account (1.4 TeV scaled to 1.5 TeV)

Generator level cuts reflecting detector acceptance:

- require lepton energy $E_l > 5\,\text{GeV}$ and lepton angle $\Theta_l > 100\,\text{mrad}$
- no ISR photon with $E_\gamma > 10\,\text{GeV}$ and $\Theta_\gamma > 100\,\text{mrad}$

$h_{125} \to Z\,Z$

[CMS Run I, Phys. Rev. D 89 (2014) 092007]

Relevant BSM searches:

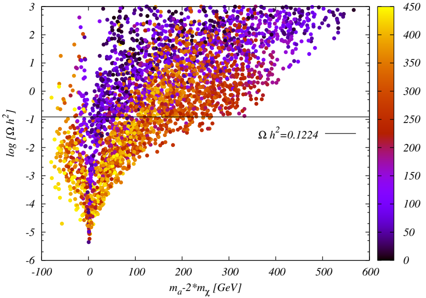
$H/A \to \tau\,\tau$ [ATLAS Run II, Phys.Rev.Lett. 125 (2020) no.5, 051801],

$H \to h_{125} h_{125}$ [ATLAS 2018 data, JHEP 1901 (2019) 030],

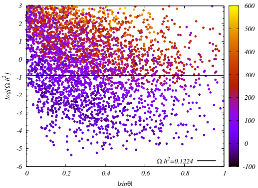
$A \to H/h_{125} Z$ [ATLAS 2018/ full Run 2 data, Phys.Lett. B783 (2018) 392-414, ATLAS-CONF-2020-043]

Example: Dark matter constraints

using MadDM



color coding: m_χ



color coding: $m_a - 2\,m_\chi$

dominant channels: $\chi\,\bar{\chi} \rightarrow t\,\bar{t},\ b\,\bar{b}$, depending on m_a

main result: $|m_a - 2\,m_\chi| \leq 300\,\mathrm{GeV}$

LHC searches

Model widely promoted by LHC Dark matter working group

$\Rightarrow$ searches considered:

1. $h + \not{E}_\perp$: ATLAS, Run II dataset [JHEP 11 (2021) 209]
2. $\ell\ell + \not{E}_\perp$: CMS, Run II dataset [Eur. Phys. J. C 81 (2021) 13]
3. $W^+\bar{t}/W^- t\, +\, \not{E}_\perp$: ATLAS, Run II dataset [Eur. Phys. J. C, 81:860, 2021]
4. $H^+\,\bar{t}b,\ H^+\,\rightarrow\, t\,\bar{b}$: ATLAS, Run II dataset [JHEP, 06:151; JHEP 06 (2021) 145]
5. $t\,\bar{t},\ b\bar{b} + \not{E}_\perp$: ATLAS, Run II dataset [JHEP 2104 (2021) 174; JHEP 2105 (2021) 093;JHEP, 04:165, 2021]
6. $A\,\rightarrow\,Z\,H$: ATLAS, Run II dataset [Eur. Phys. J., C81(5):396, 2021]

- (4), (5) not relevant due to $\tan\beta\,\gtrsim\,1,\ m_b$ small
- (6) also not relevant (large masses $m_A,\ m_H\,\gtrsim\,m_a$)
- others: cut out some part, dominantly via $h + \not{E}_\perp$
- **but:** all parameter float $\Rightarrow$ no 2-dim clear distinction
