The muon g-2 at a high-energy muon collider: simplified models analysis

Friday, 8 July 2022 20:10 (20 minutes)

The long-standing tension between the Standard Model prediction and the measured value of the muon anomalous magnetic moment can be addressed by new physics in the TeV range. Simplified models provide a way of understanding concretely how the discrepancy is tackled, and make it possible to predict other observables corellated with the muon g-2. In this talk I will explore the predictions which are testable at a future high-energy muon collider, identifying some crucial processes which are unique signatures of these models.

In-person participation

Yes
