

New GDML model of IP and SVT L0

Riccardo Cenci
University of Maryland

SuperB General Meeting, Pasadena, CA

December 14th, 2010

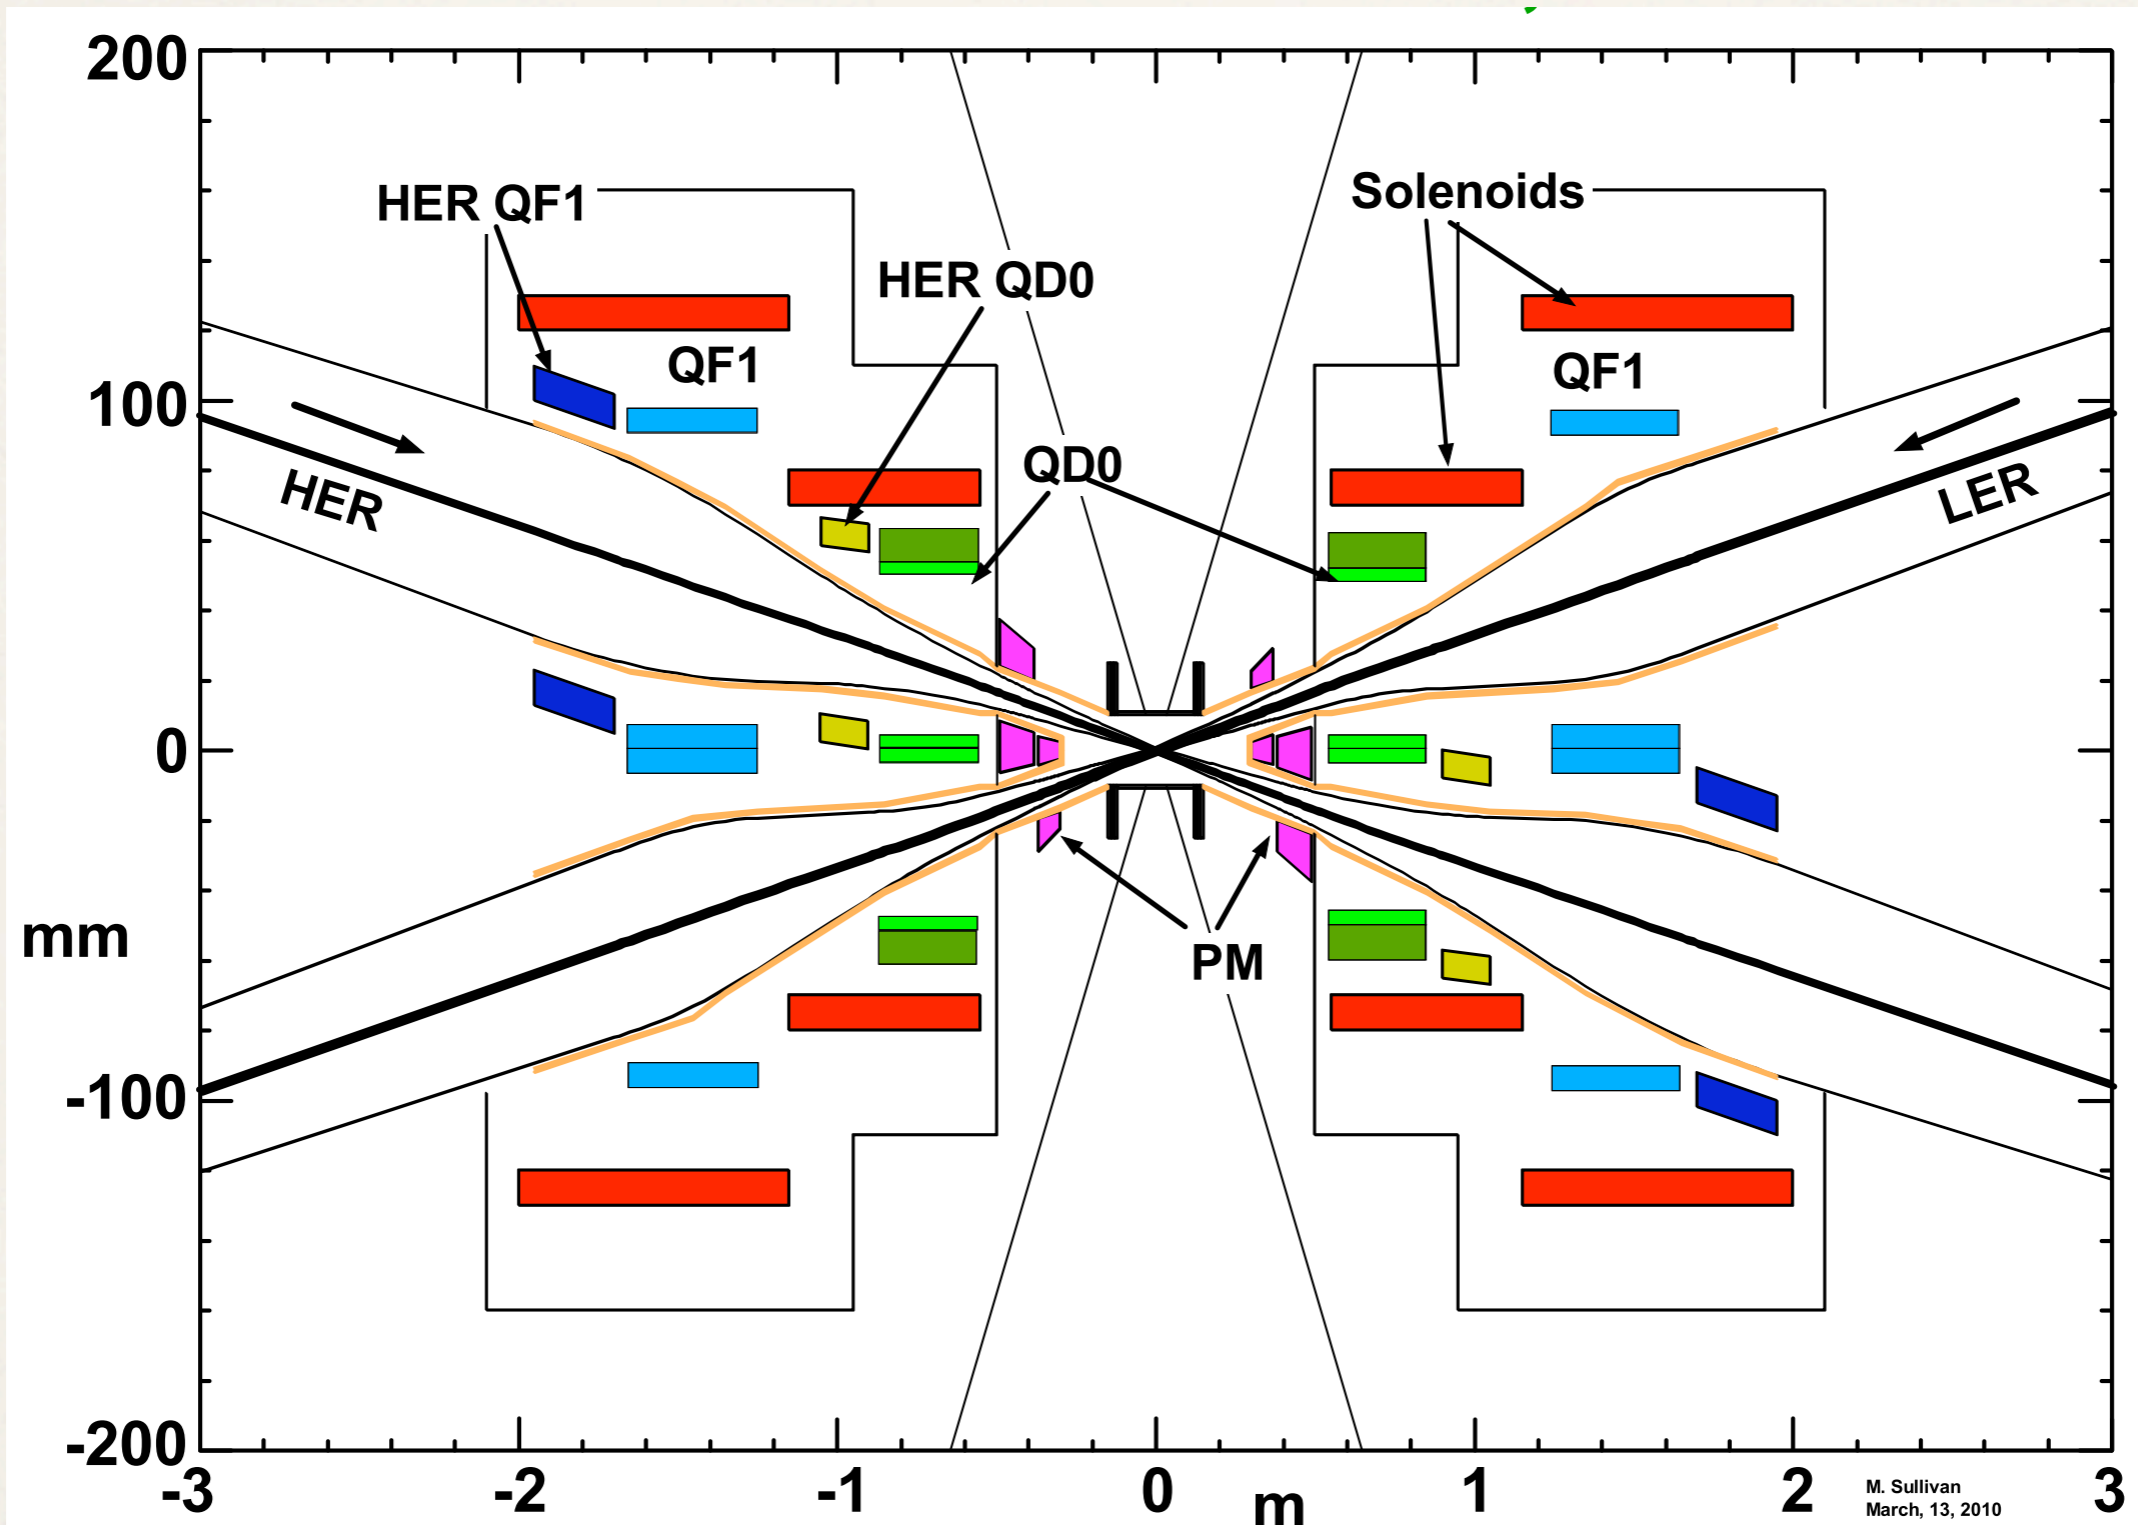

Previous status

- The SuperB geometry is implemented in Bruno through GDML description
 - Pro: easy to change without recompile
 - Cons: scripting is not flexible as C++, complex volumes partially generated without warning and have visualization problems
- Previous geometry was simple:
 - Cylindric beam pipe, solid beryllium
 - Stainless steel split pipes and following
 - Bulky tungsten shield
 - No cooling, flanges, bellows or support structure
 - Cylindric Svt L0 w/o cooling or HDI

New geometry

- Realistic structure around the IP from Filippo B. and Mike S. designs
 - Beryllium beam pipe with cooling and support structure
 - Steel pipes with bellows and flanges until ± 86 cm on z axis
 - Pipes extended further down not according the design
 - Pinwheeled L0 with cooling, HDIs and support
 - Tungsten shield closest to the IP (beaks) has been removed to allocate cooling and support structure

Mike S. design (Frascati Sep 10)

New geometry around IP (top view)

- L0 cooling manifold
- Beampipe manifold
- Bellow
- Flanges
- Split section
- LER/HER pipes

New geometry around IP (top view)

- Reduced tungsten shielding (beaks removed)

Filippo Bosi design

New geometry around IP

- Pinwheeled L0
- Min radius 13 mm
- Hdi implemented but missing in the committed geometry due to a mistake

New geometry around IP

- HDIs are in but they were commented out by mistake

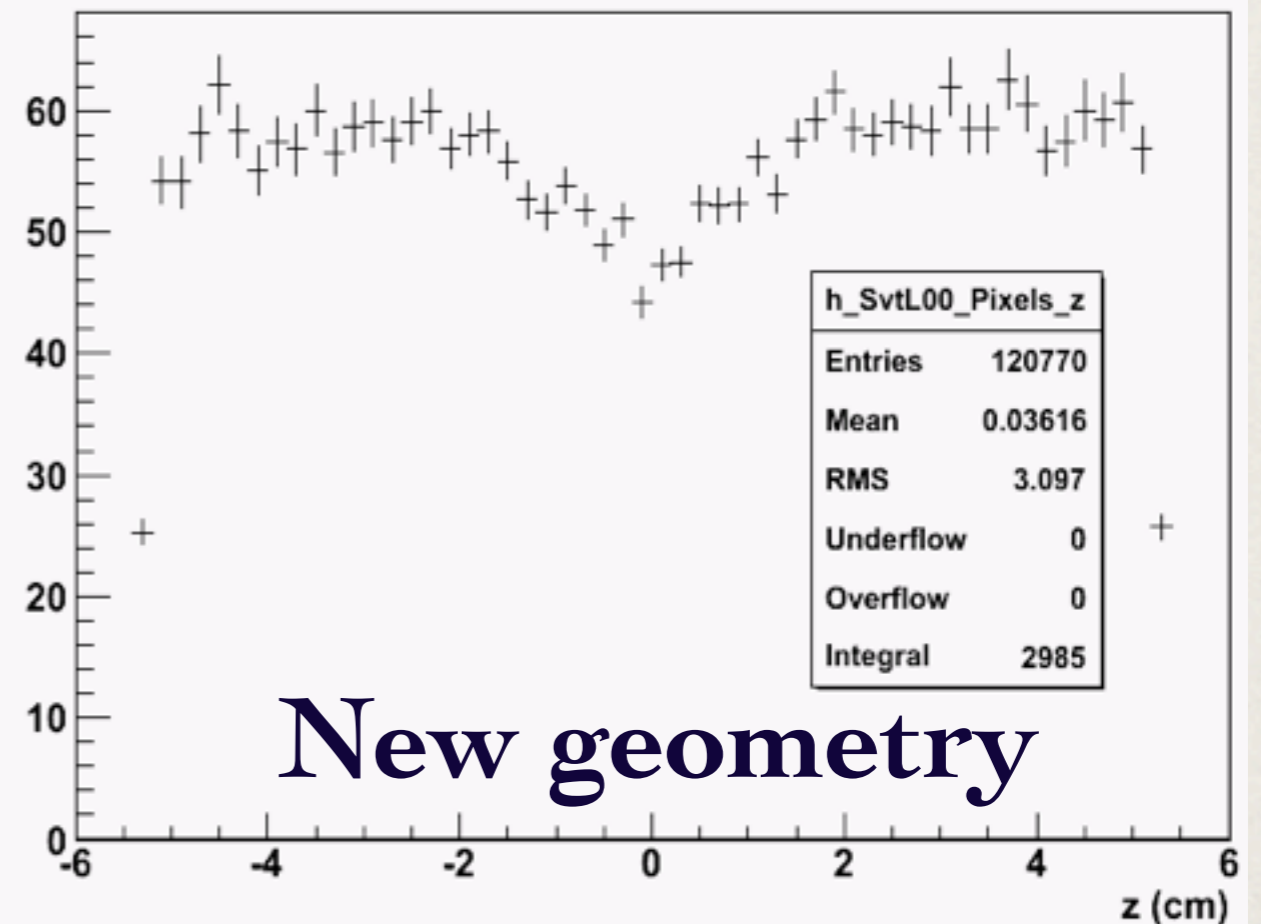

Background: SVT

- 2photon (aka pairs): rate is slightly decreased but still higher than requested, 56 MHz/cm² (was 64)
- RadBhabha: decreased as well, 4.6 MHz/cm² (was 5.4)

PixelsON distribution vs Z on Svt Layer 0

PixelsON distribution vs Z on Svt Layer 0

Background: DCH

- Background study still under validation, results depend from simulation parameters, very preliminary
- 2photon (aka pairs): 1.5% -> 10.5% due to a lower cut on p_T
- RadBhabha: 5% -> 20%, to be validated

Conclusions

- Implementation of the new geometry according to the last designs
- Missing pieces, like magnets (currently only QD0's are in)
- Small effect on SVT background, even lower bkg
- Big increase in occupancy for DCH, to be validated

Dch background: 2photon bkg

- Very preliminary results (and not validated method to calculate occupancy)
- New events, same geometry:
 - Much higher occupancy: 1.5% \rightarrow 10.5%
 - 2photon events now have lower pT cut

Dch background: 2photon bkg

- Very preliminary results (and not validated method to calculate occupancy)
- New geometry, occupancy 10.5% \rightarrow 9.6%

Dch background: RadBhabha bkg
