

Neutron Damage on SiPMs studies at LNL

XV SuperB General Meeting Caltech

Report of the work done in Padova
Dal Corso F., E.F., Simi G., Stroili R.

University &
INFN Padova

Outline

Studies on-going on different Silicon G-APDs

- FBK (Irst), Hamamatsu, 1 mm² to 9 mm²
- Measuring the gain
- Radiation Tests @ LNL (INFN Legnaro National Labs)
 - Different energy, fluence and G-APDs
 - Preliminary Comparison
 - New Setup: added a Neutron Moderator

Neutrons irradiation tests @ LNL

- Device irradiated during tests in June and July:
 - 2 G-APD (1 mm² - 50 μm pixel size – from Hamamatsu)
 - 1 G-APD (1 mm² - 40 μm pixel size – from FBK)
 - 1 G-APD (1 mm² - 50 μm pixel size – from FBK)
 - 1 G-APD (2x2 mm² - 50 μm pixel size – from FBK) .
- Deuteron beam over beryllium thick-target: ${}^9\text{Be}(d,n){}^{10}\text{B}$
- E_d : 4 MeV
- Beam current: 20-60 nA
- Temperature 20°C
- 2 different sets of measurements
 - 28,29-June and 8,9 July 1 Hamamatsu & 1 FBK both 1 mm²
 - 23 and 26 July 1 Hamamatsu 1mm² & 1 FBK 4mm²
 - 8-9 Nov 1 Hamamatsu 1mm² & 1 FBK 1mm²

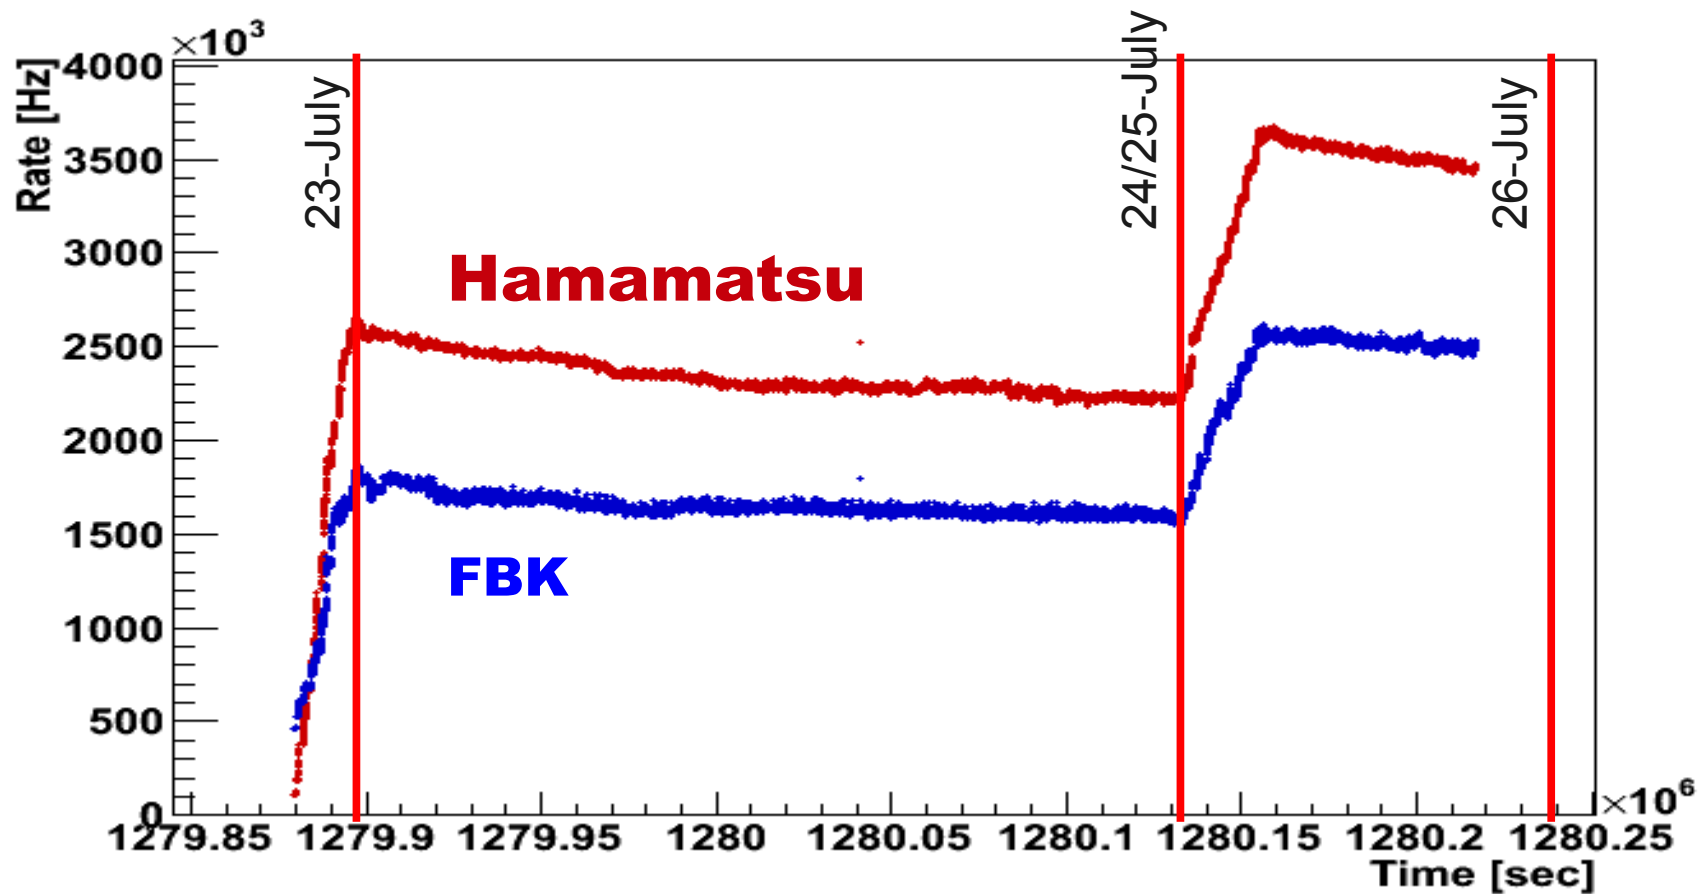

First sets: Dark Counts Rate @1.5p.e. vs Time

● Reached Fluence of $N_{1\text{MeV}}$ eq $\sim 2 \times 10^{10}$:

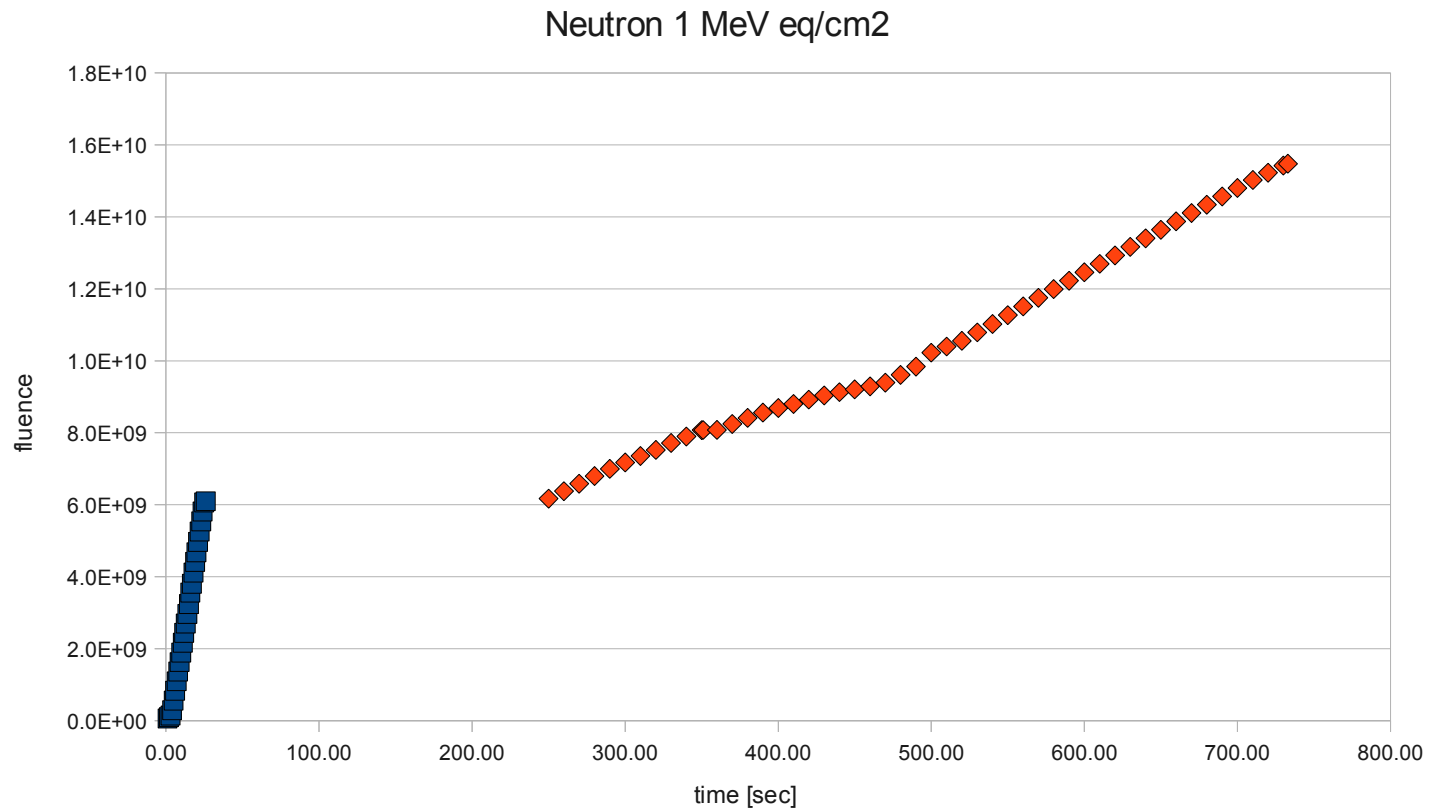

Second Set: Dark counts rate @ 1.5 p.e. Vs Time

- Reached Fluence of $N_{1\text{MeV}} \text{ eq} \sim 8 \times 10^9$:

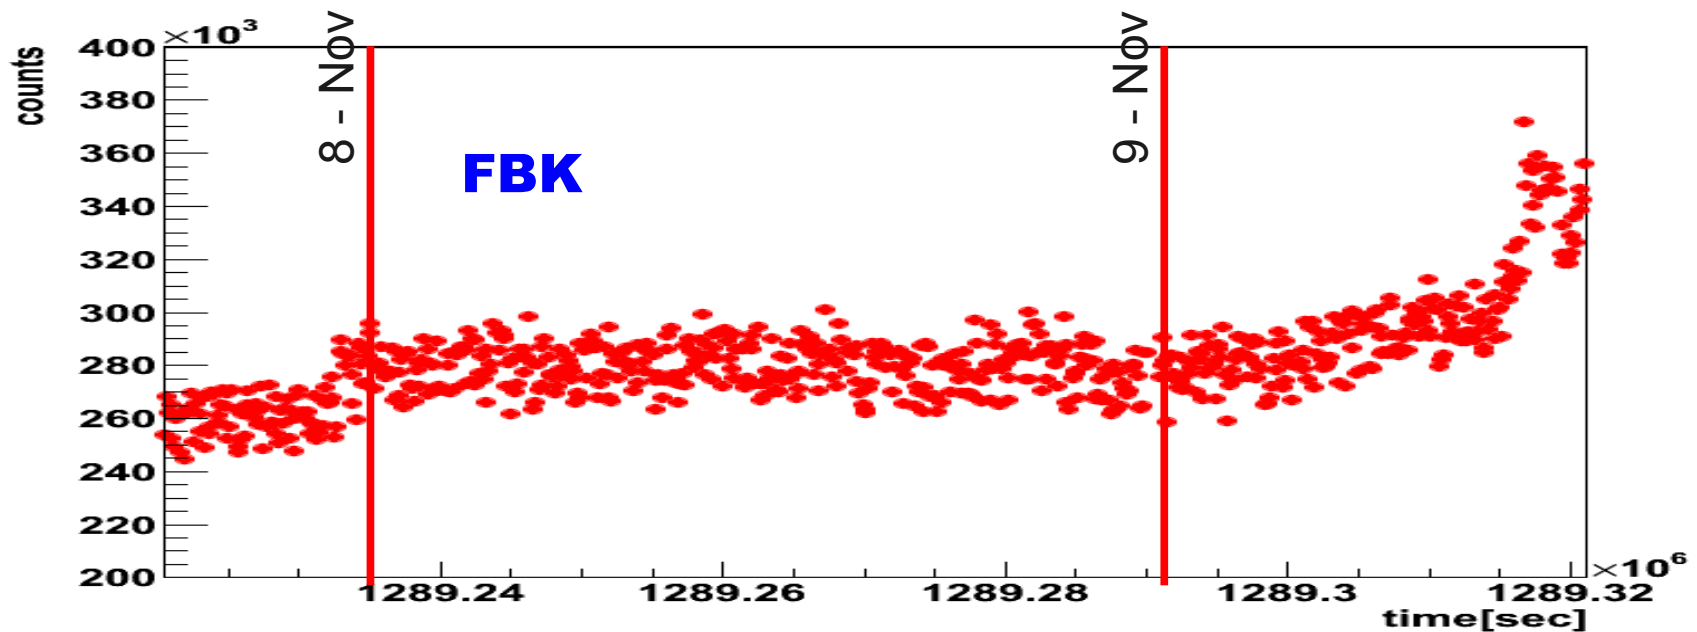

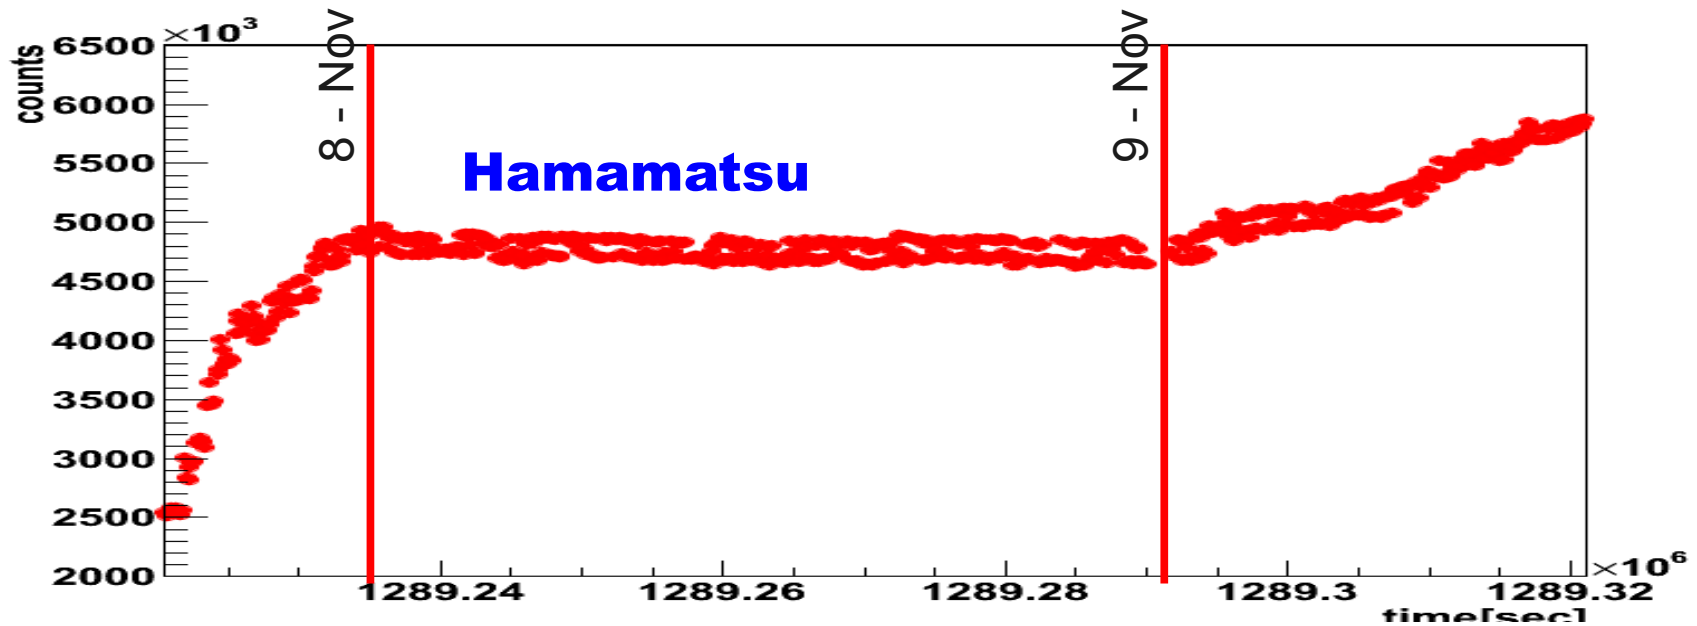

Third Set: added a Moderator

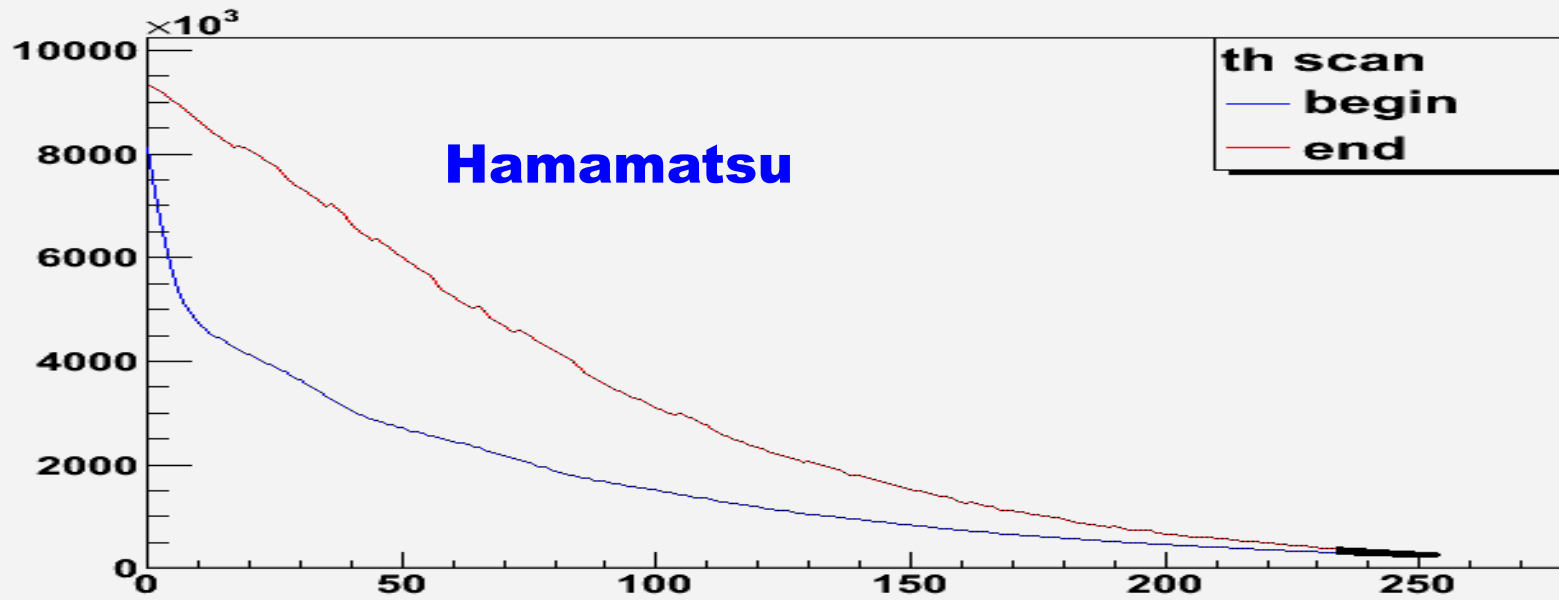

- Put 10cm of Neutron Moderator (“just” Water) between the neutron beam and the Silicon
- Reached Fluence of $N_{1\text{MeV}} \text{eq} \sim 1.6 \times 10^{10}$ on the moderator

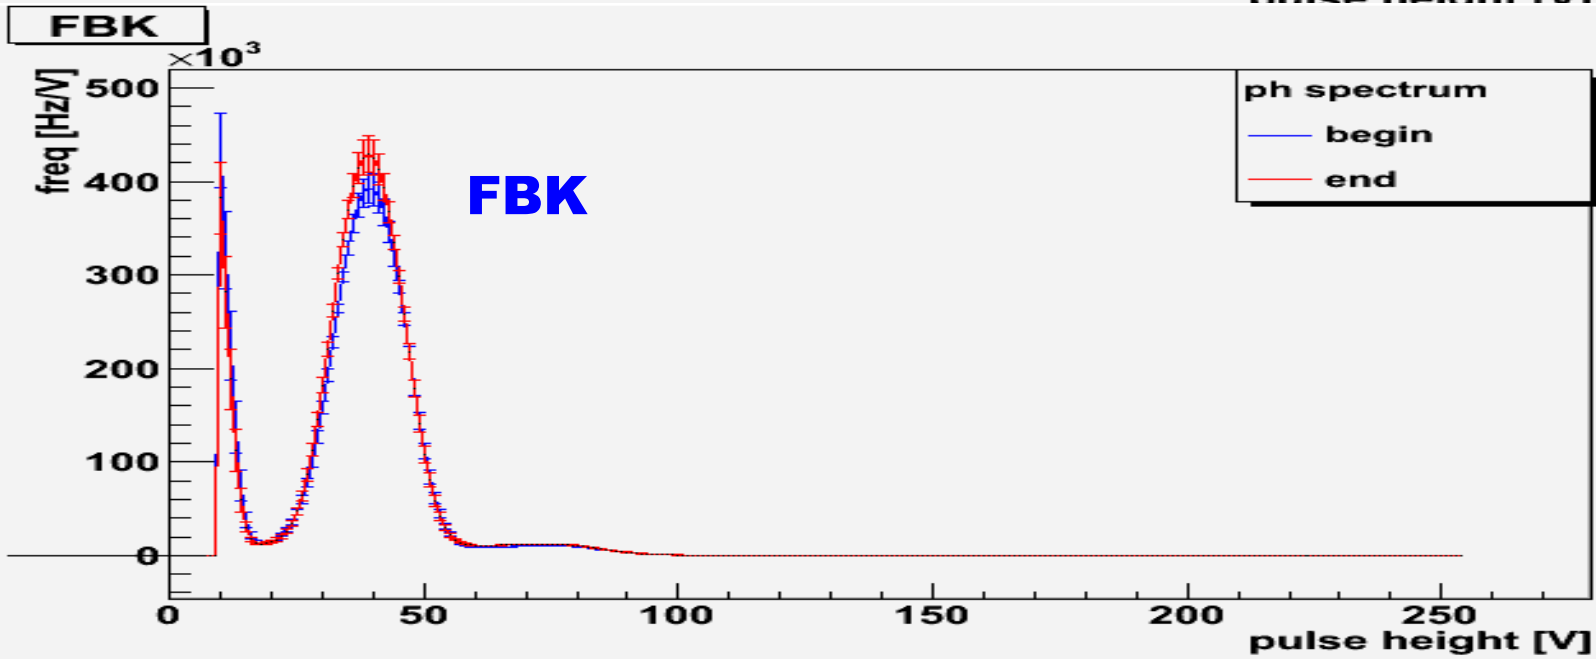

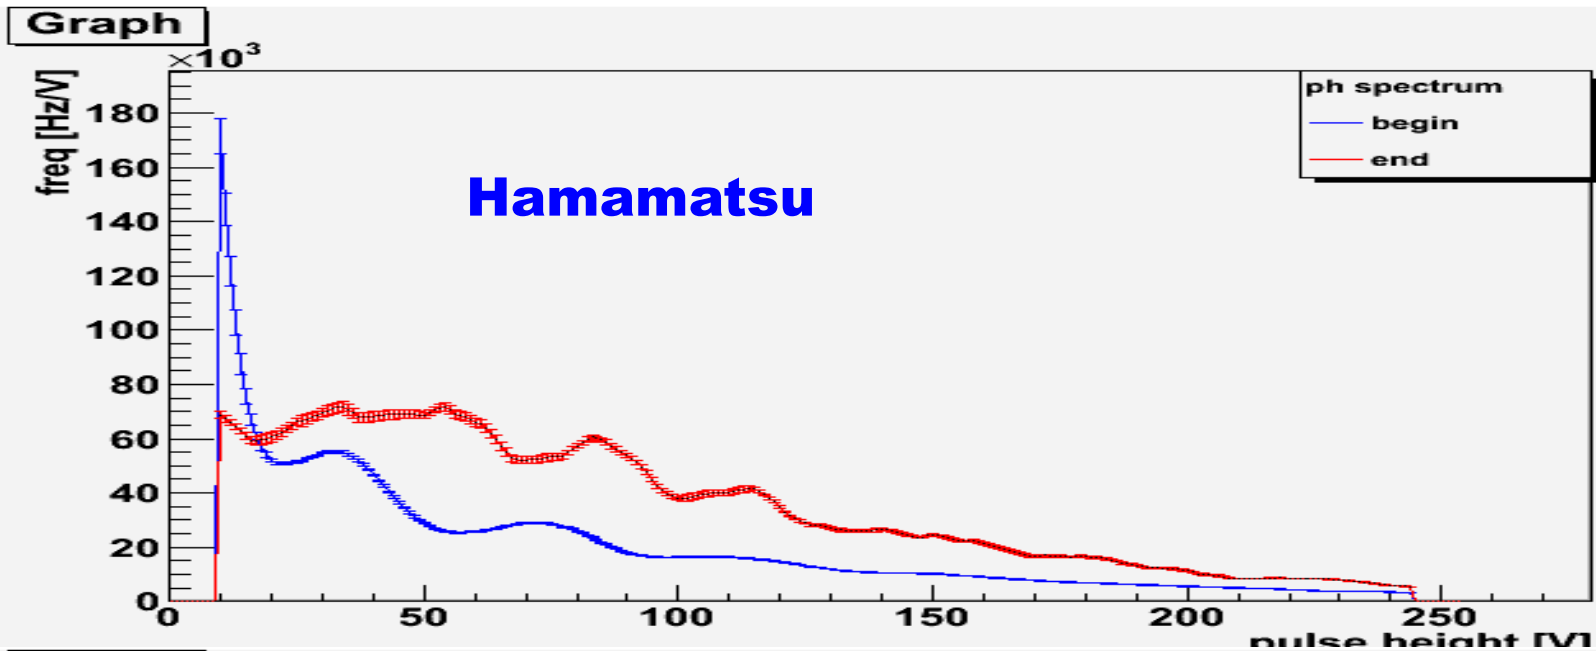

Third Set: Dark counts rate @ 1.5 p.e. Vs Time

Third Set: Threshold scan

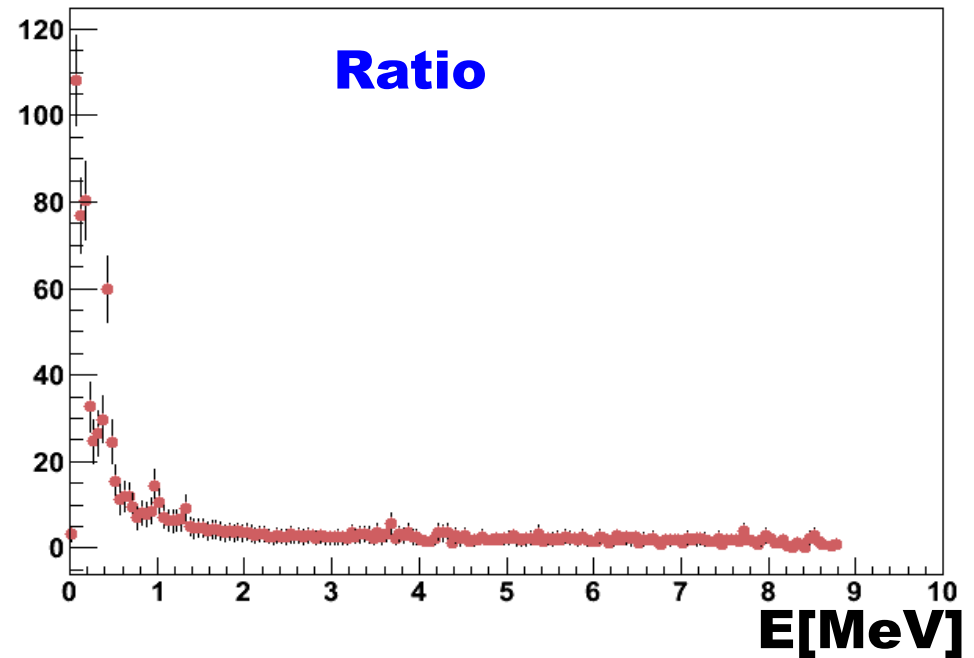

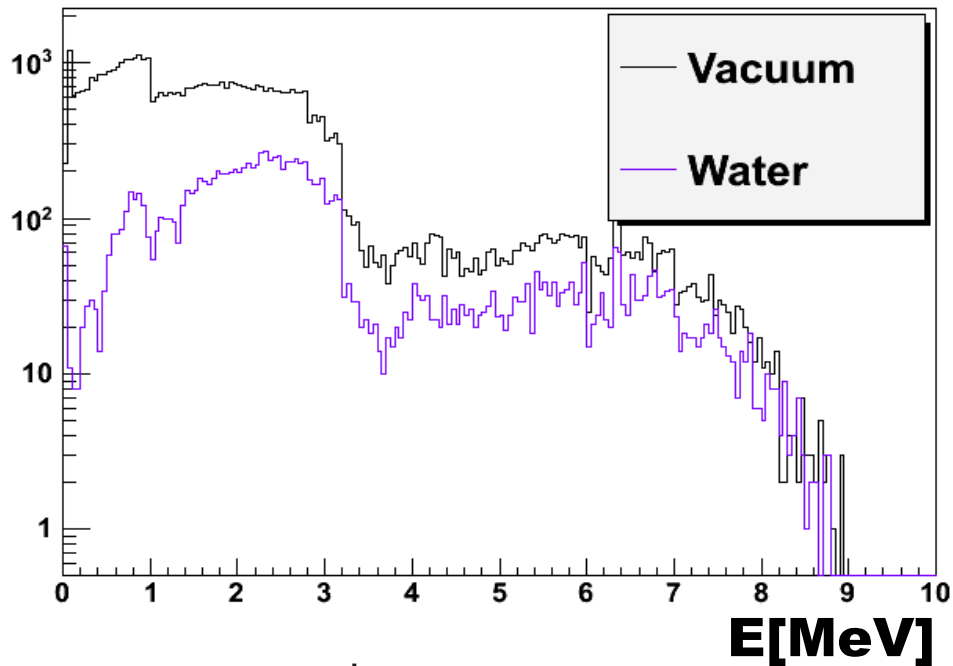

Third Set: Spectrum

Third Set: Preliminary Simulation

Studies the neutron fluence using Geant4 simulation

- Using QGSP_BERT_HP physics list for hadron
- Standard EM & Optical
- Neutron Gun from a Paper of J.W. Meadows*

* Meadows, James W. Nuclear Instruments and Methods in Physics Research Section A, Volume 324, Issue 1-2, p. 239-246.

The ${}^9\text{Be}(d, n)$ thick-target neutron spectra for deuteron energies between 2.6 and 7.0 MeV

Summary/to-do

- Using a Moderator seems to give promising results concerning radiation hardness for FBK devices :-)
 - Work on the simulation to understand better what's going on
- Tests with other moderator (paraffin, graphite,...) have been planed
- Try to get in touch w/ MPI Munich to get a few samples of Si-PMs w/ bulk integrated quench resistors
 - no answer so far :-)

NIEL-scaling theory

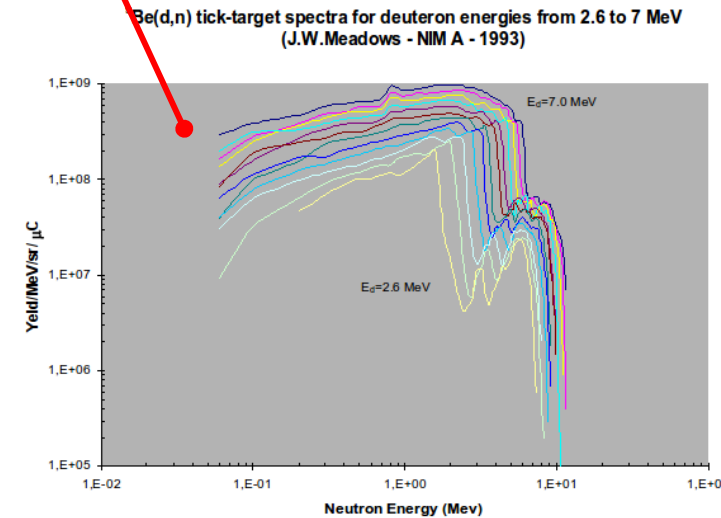

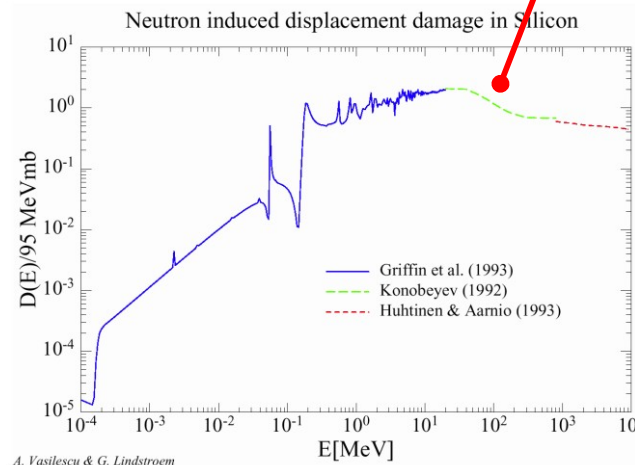

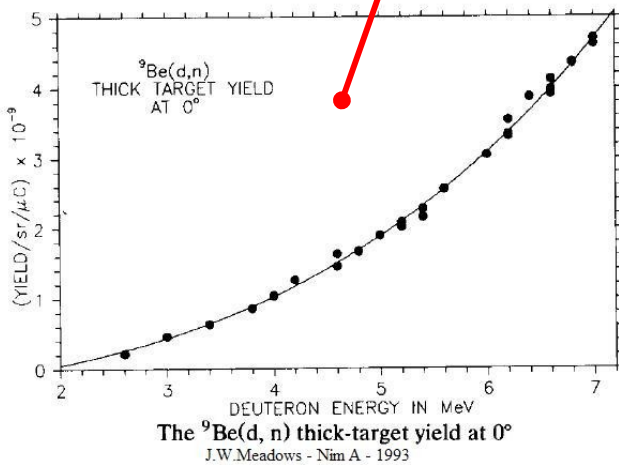

Any particle fluence can be reduced to an equivalent 1 MeV neutron fluence producing the same bulk damage. The scaling is based on the hypothesis that generation of bulk damage is due to non-ionising energy transfer to the lattice.

$$\Phi_{eq} = k \cdot \Phi_{abs}$$

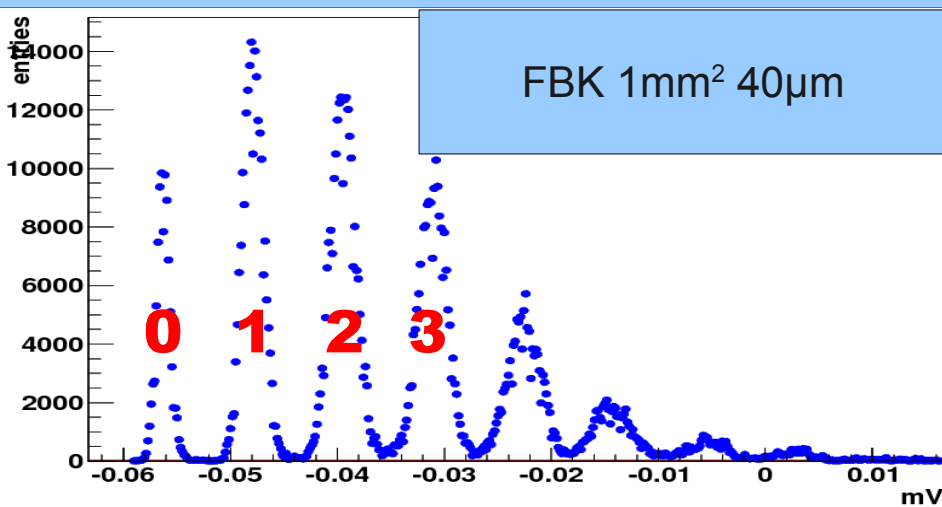

$k = k(E_d)$: "hardness parameter"

$$\Phi_{abs} = \frac{Y(E) \text{ sr} \cdot \mu\text{C}}{S_{\text{cm}^2}}$$

$$k = \frac{\int D_n(E) \cdot \sigma(E) \cdot dE}{\int \sigma(E) \cdot dE}$$

Fitting the spectrum

$$\sum_n \mathcal{G}(x; n\delta, \sigma_{tot}) \sum_{k=0}^{2k < n} \mathcal{P}(n-k, n) \mathcal{B}(k, n-k) \cdot k!$$

$x \rightarrow$ pulse height

$n \rightarrow$ number of photons

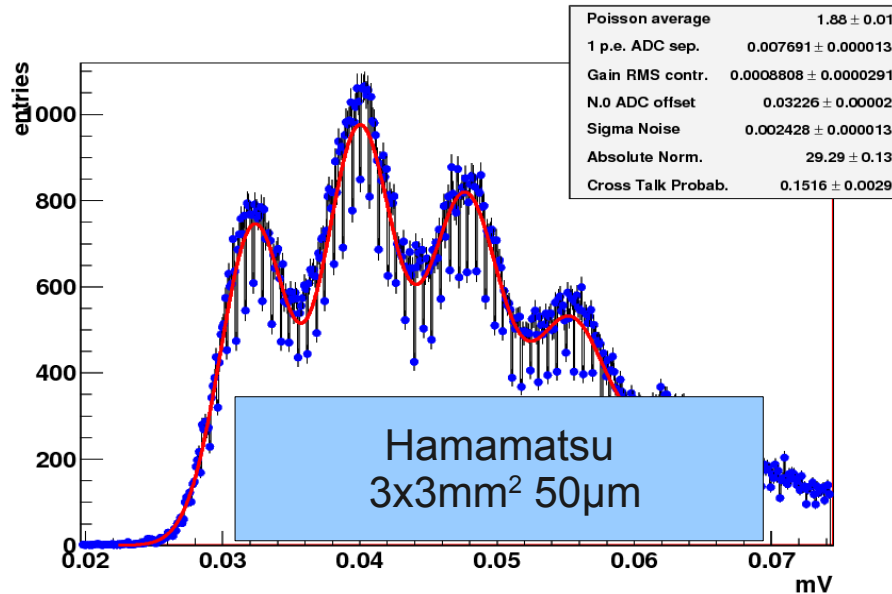

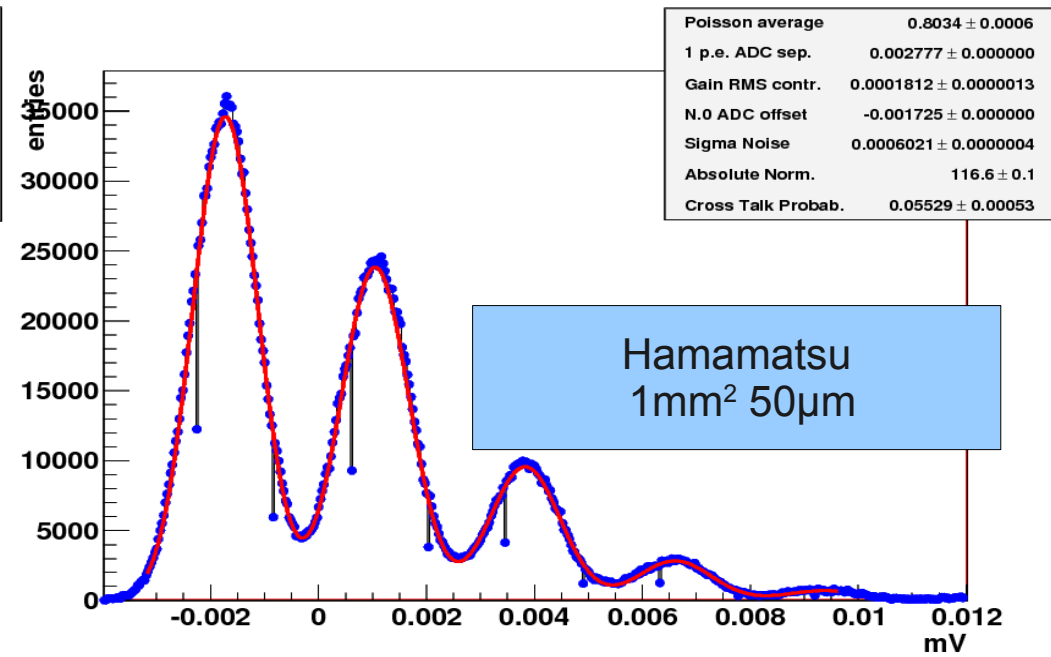

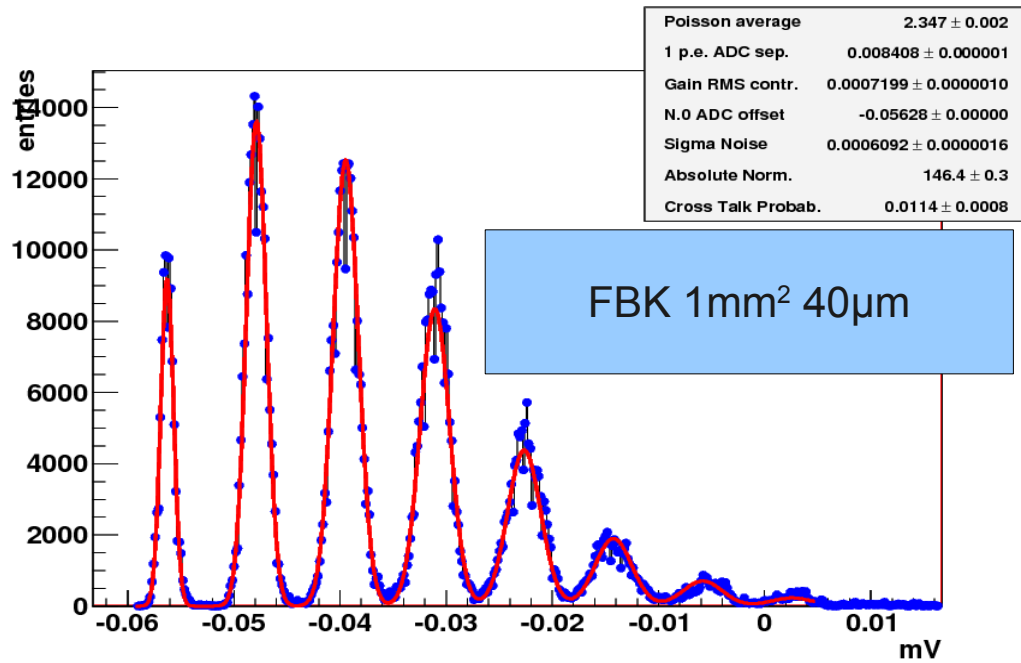

$\delta \rightarrow$ p.e. peak distance

$\sigma_{tot} \rightarrow$ electric noise and signal fluctuation

Poisson

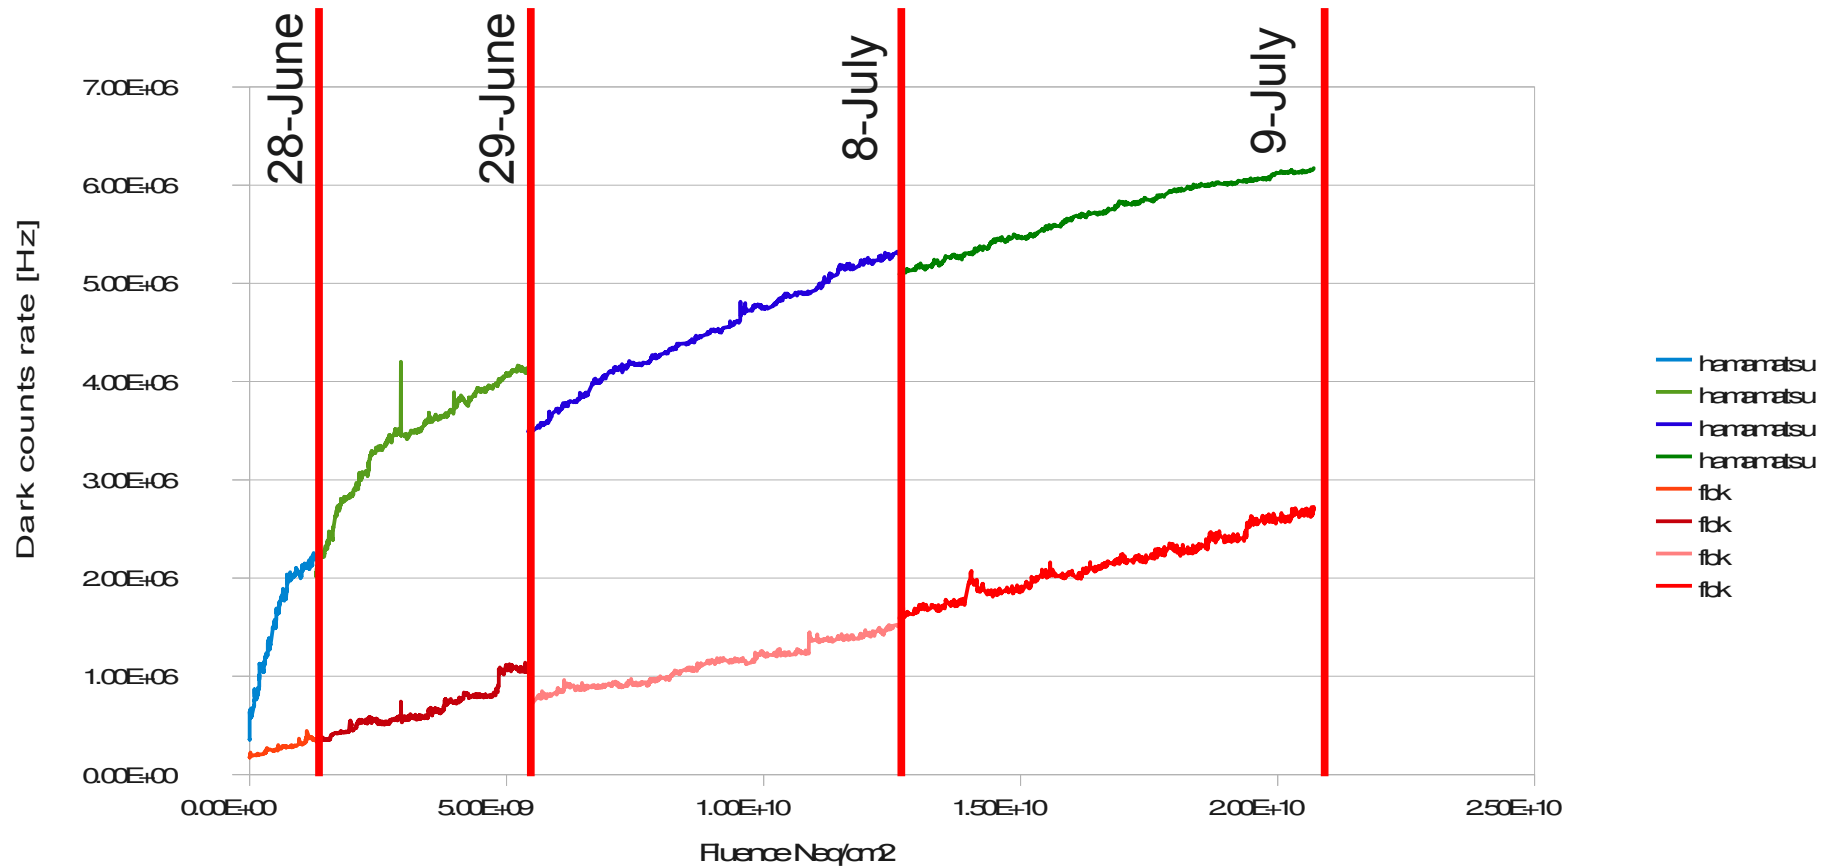

CrossTalk:
Binomial Probability

Fit Results

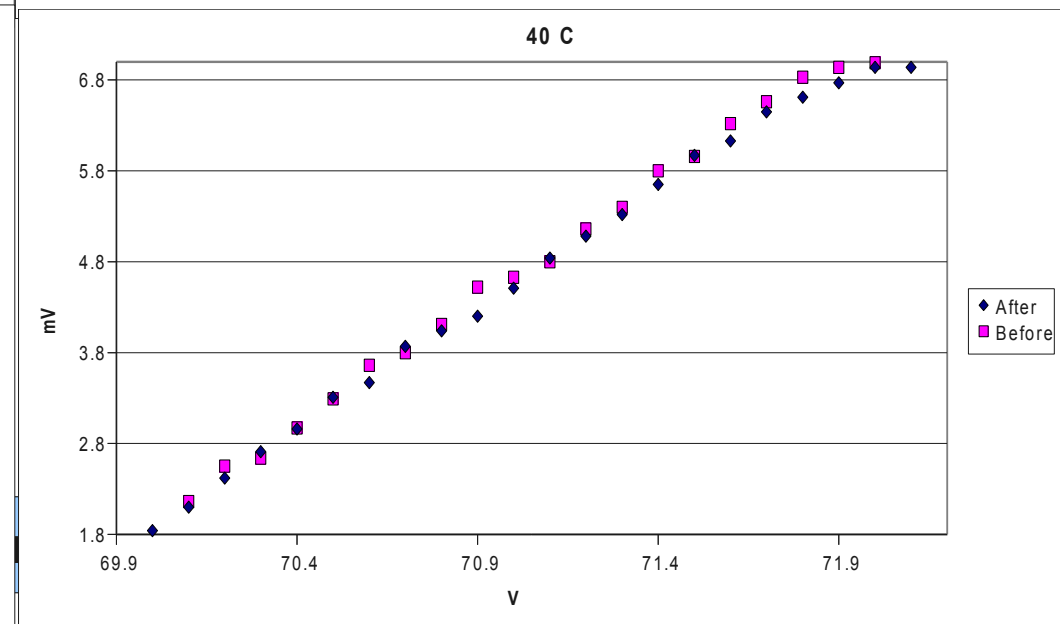

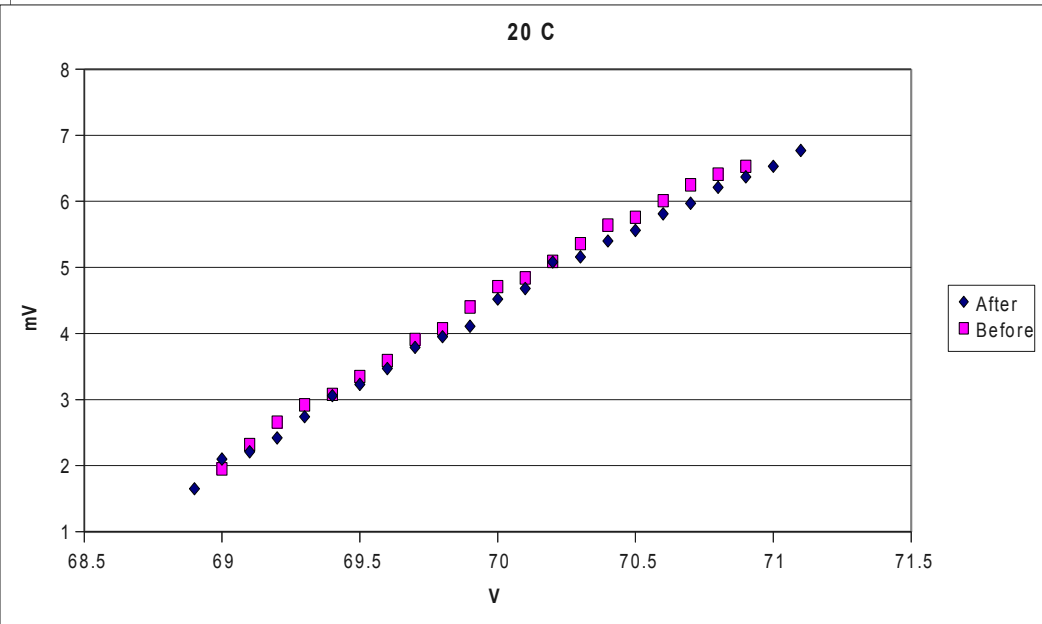

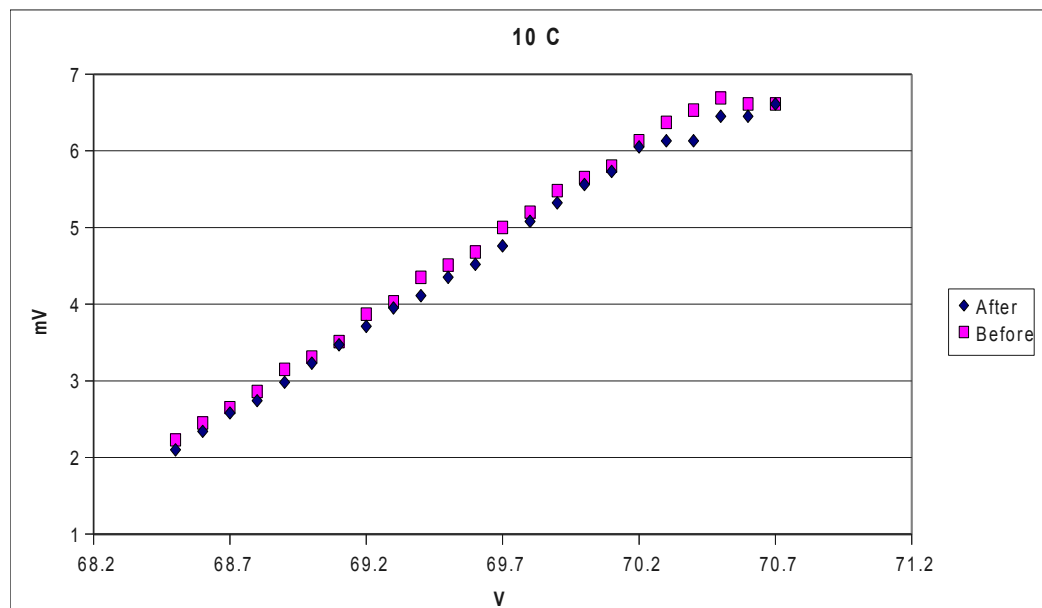

Neutron Fluence First set

- Reached Fluence of N_{1MeV} eq $\sim 2 \times 10^{10}$:

First Set Comparison: Before/After

- Gain, Hamamatsu Before and After the Irradiation for different temp.

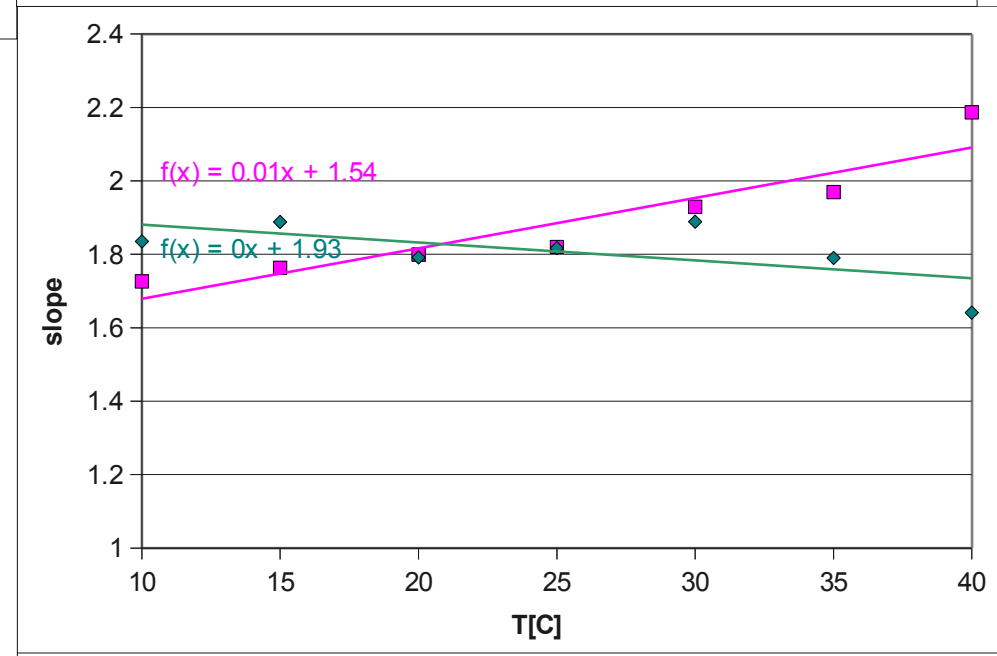

Neutron Fluence Second set

Comparison Before/After Second set

● Hamamatsu

Healing

- These two devices have been monitored for more than a month
