

Some numbers from extensive use of Global Reco

G. Battistoni

With the help of R. Zarrella, M. Franchini & C. Finck

12C_200new campaign

No. of processed events: 500000

GENFIT:

N good tracks: 472425 *See later for the definition of "Good"*

From Target: 20125 *(i.e. the reconstructed track matches with a track which in MC is recognized as a secondary produced in target)*

TOE:

N good tracks: 487653

From Target: 23442

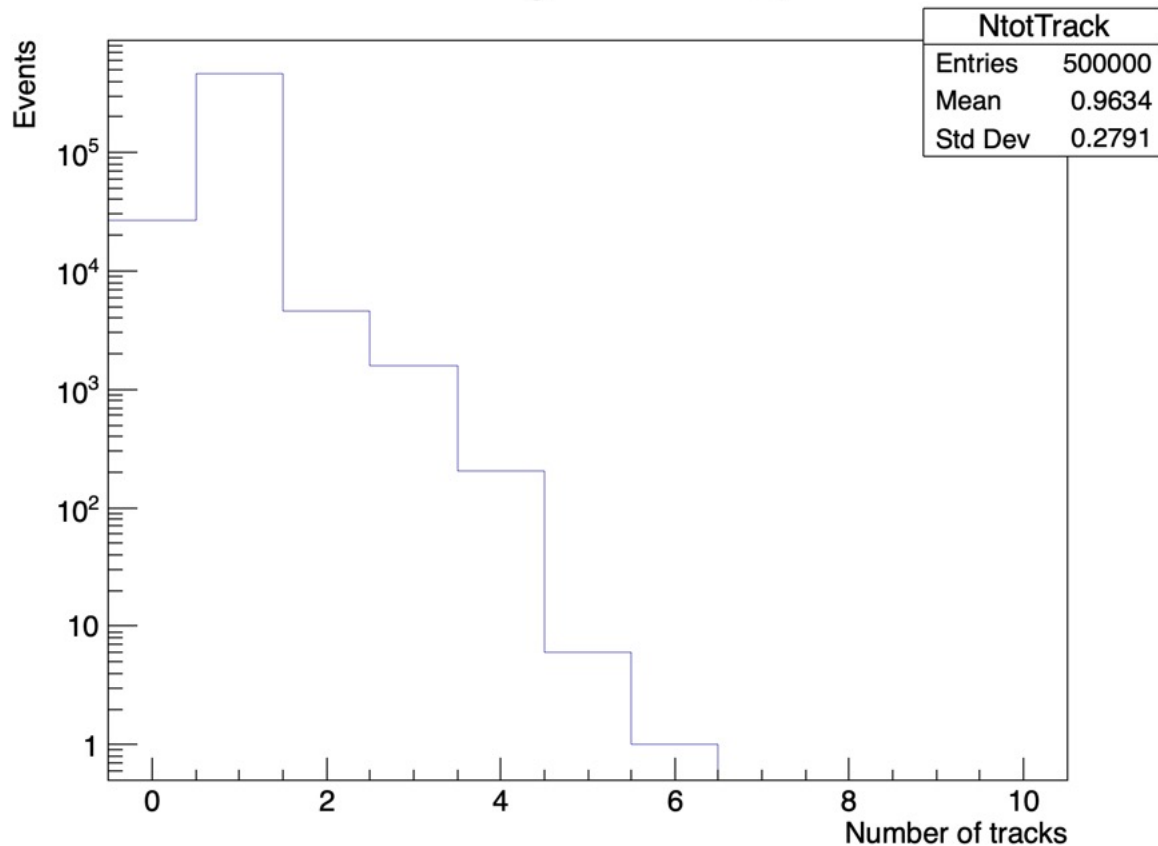

**ALL THE FOLLOWING IS TO
BE CONSIDERED AS VERY
PRELIMINARY**

No. of reconstructed glb tracks/events

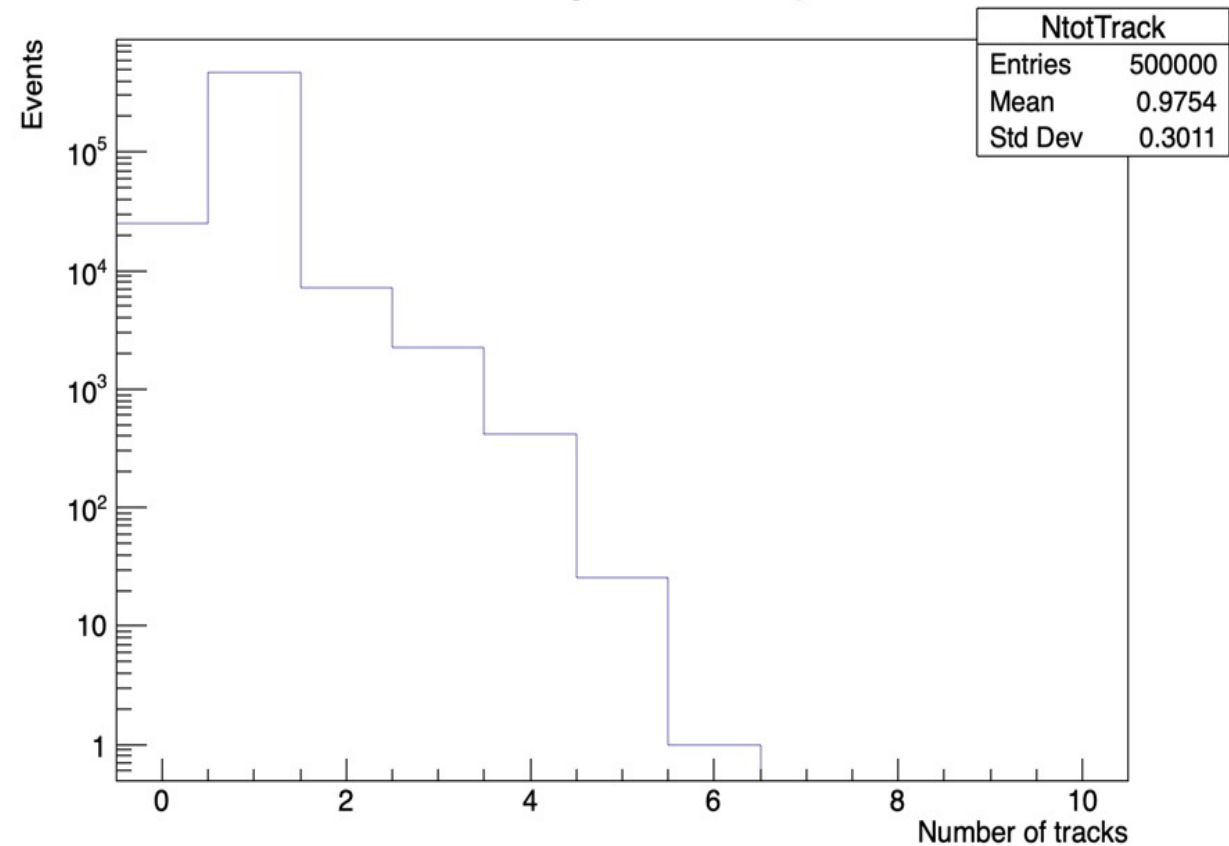

GENFIT

TOE

Number of reco global tracks per event

Number of reco global tracks per event

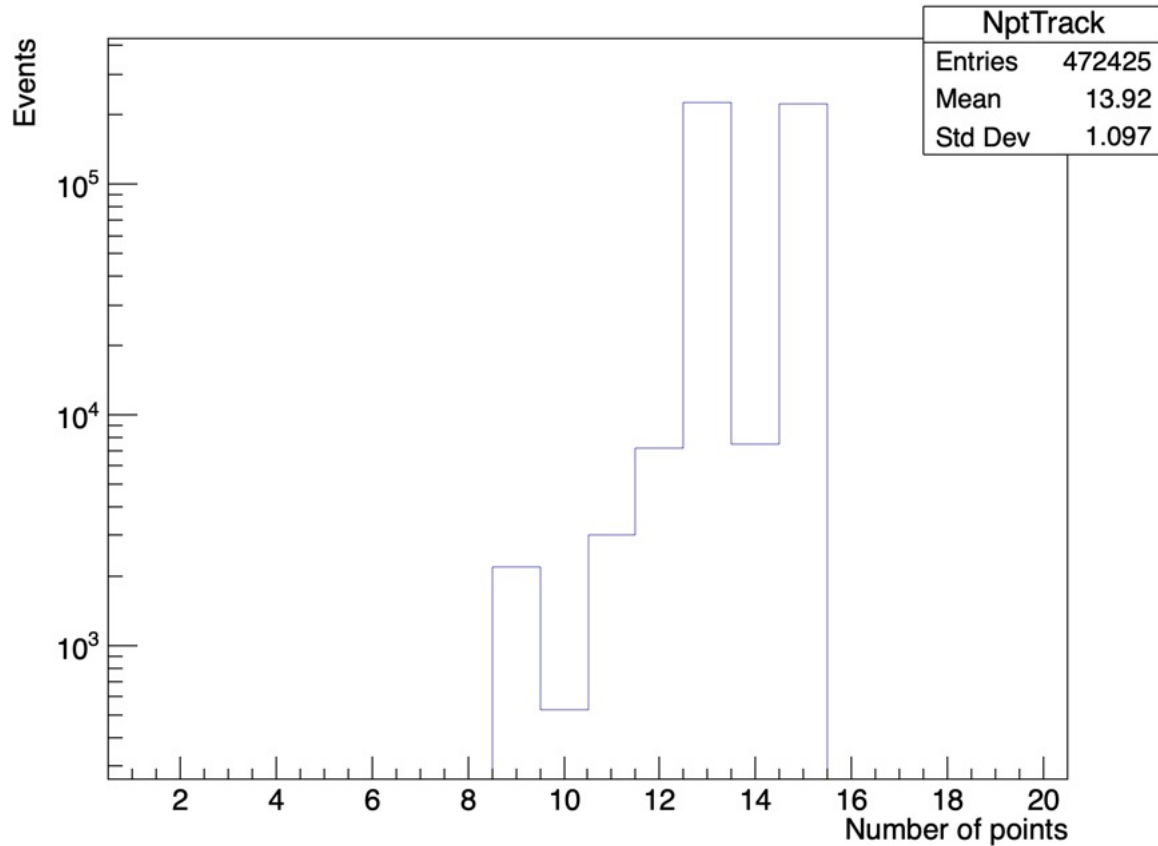

Existence of 0: In principle we should have always at least 1 track (the primary). However there can be interactions along the path, and the reconstruction rejects the track candidate

No. of points/track

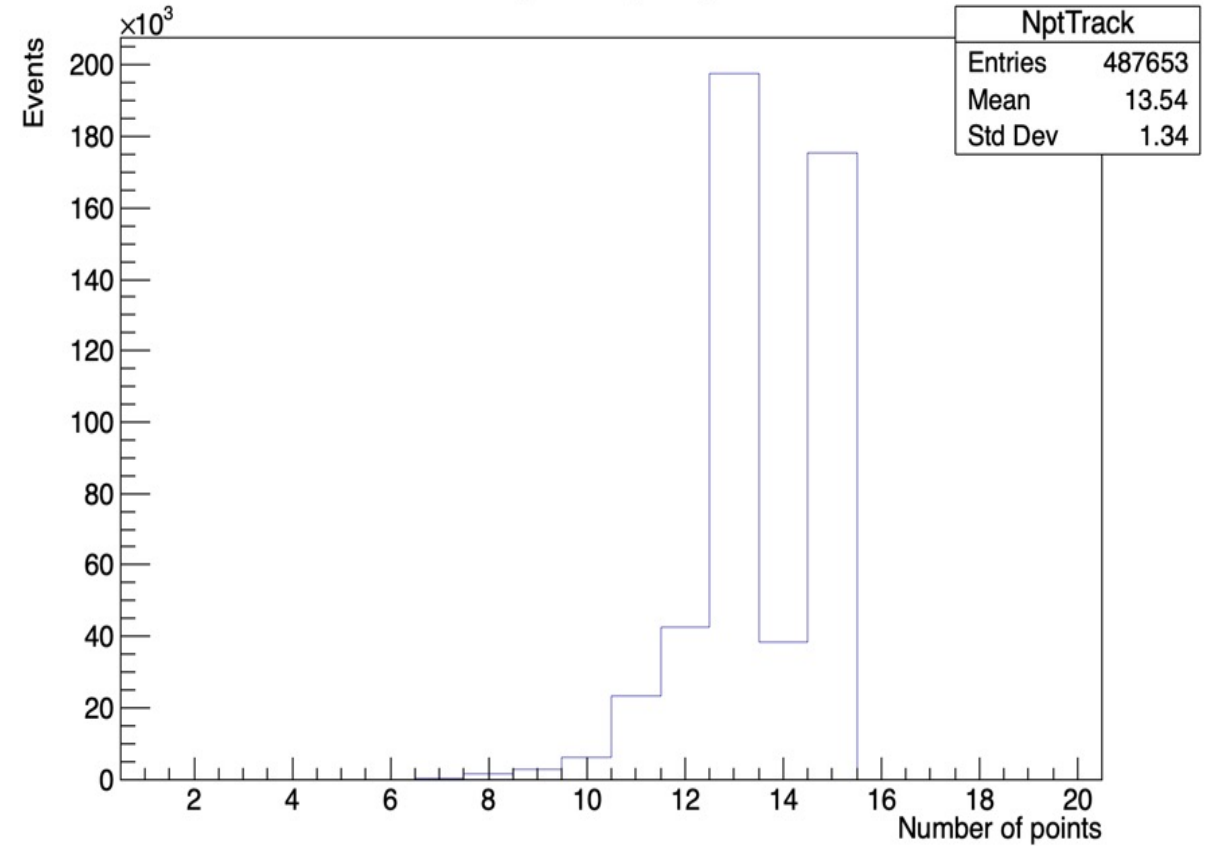

GENFIT

Number of points per global track

TOE

Number of points per global track

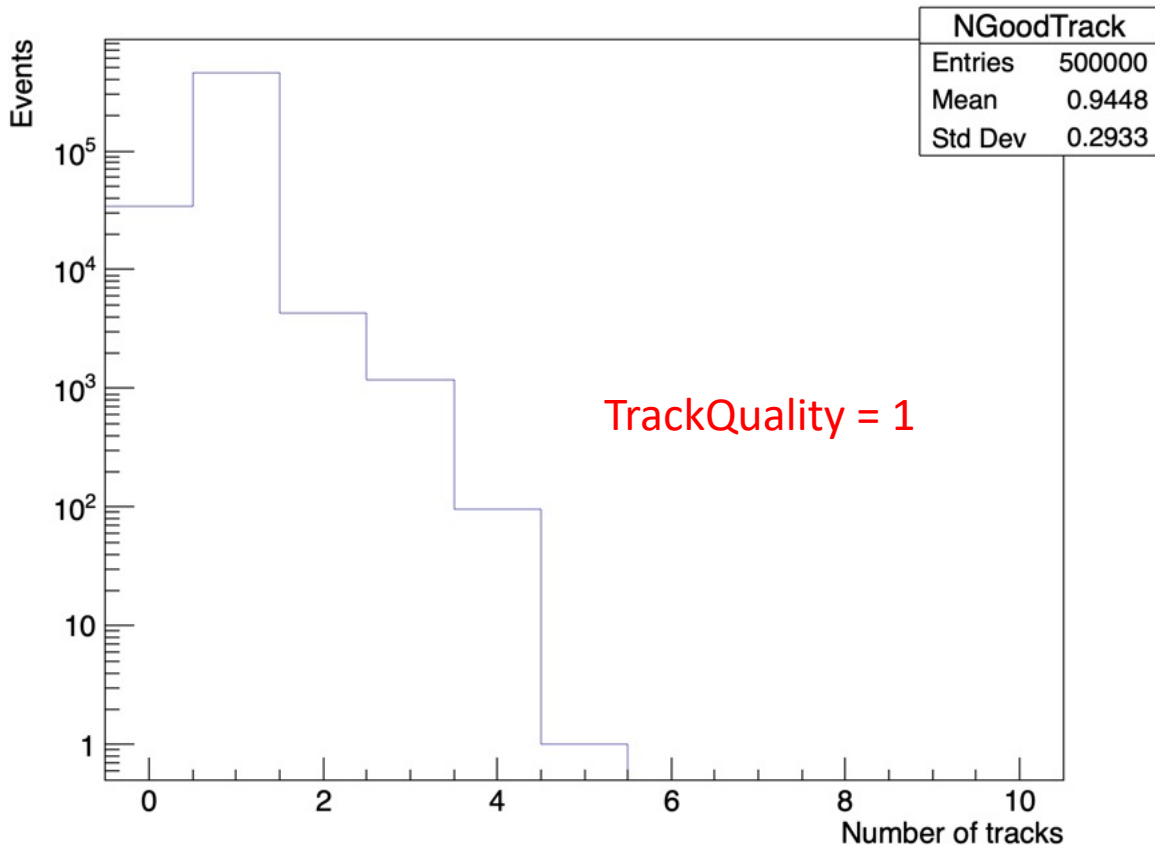

For Genfit: a threshold of at least 9 points has been asked

No. of “good” glb tracks/events

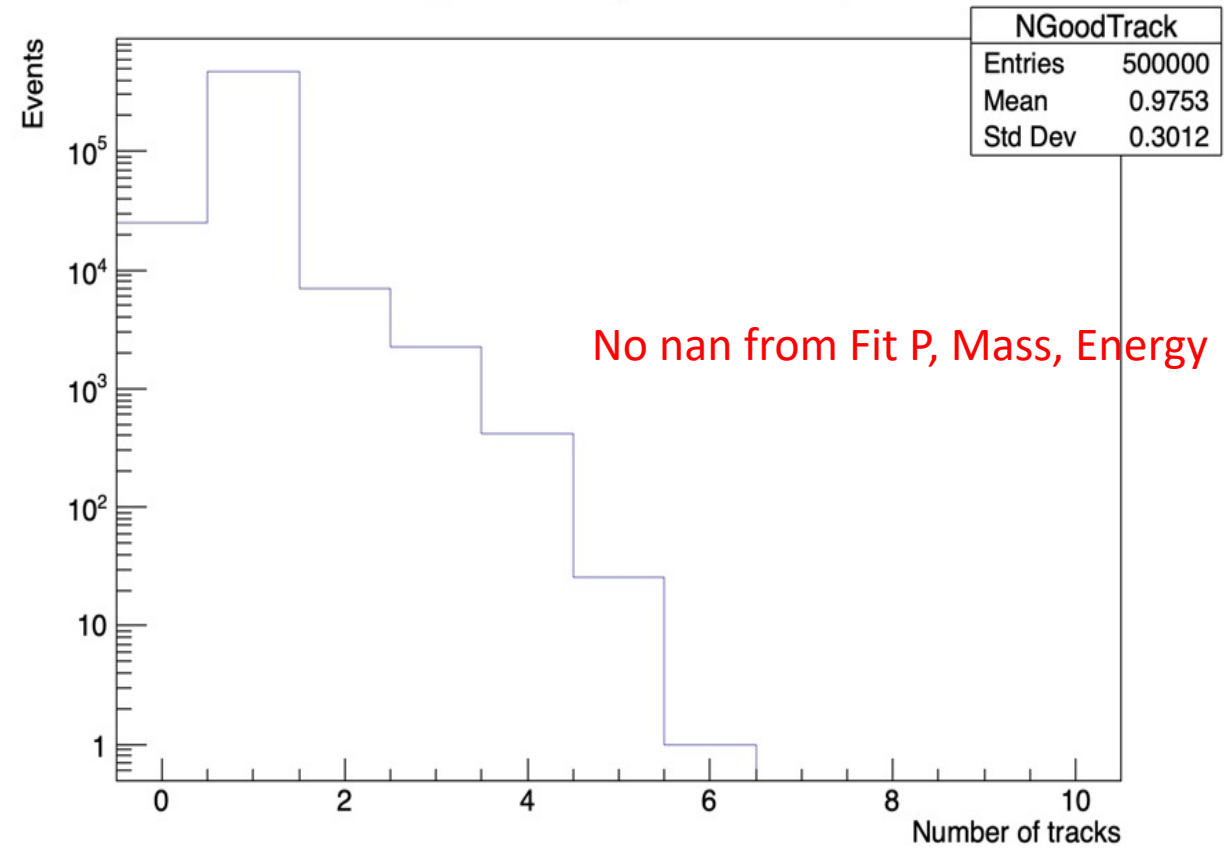

GENFIT

Number of good reco global tracks per event

TOE

Number of good reco global tracks per event

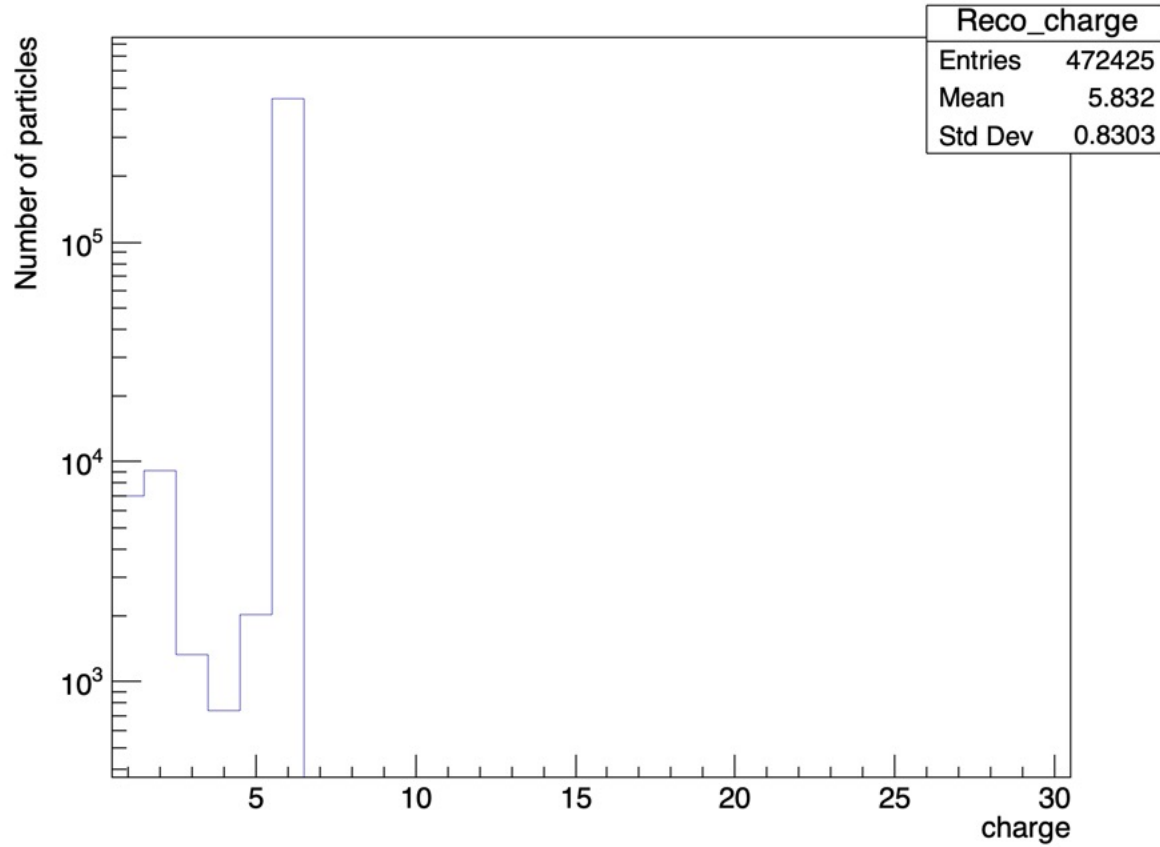

For TOE there is not an equivalent of GetTrackQuality()

Reconstructed ChargeZ

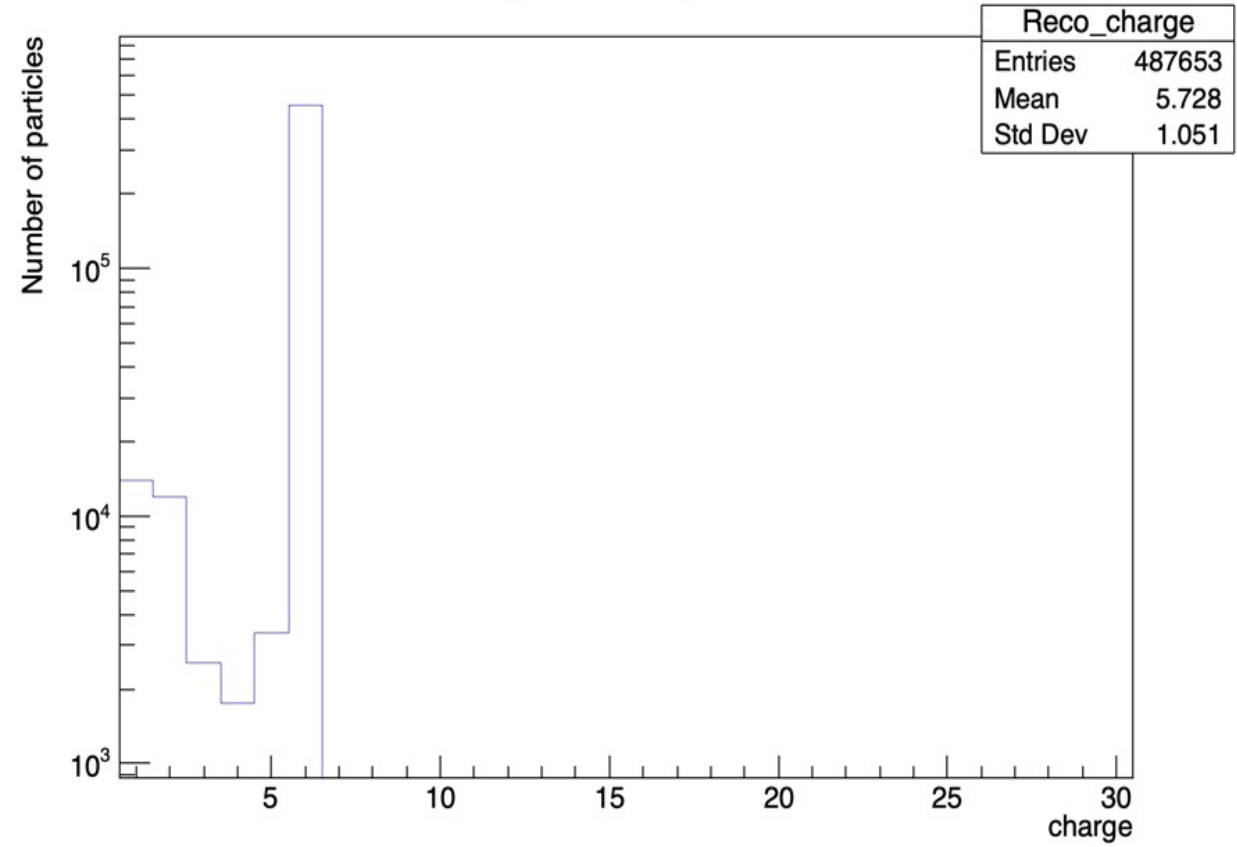

GENFIT

Charge of reco particles

TOE

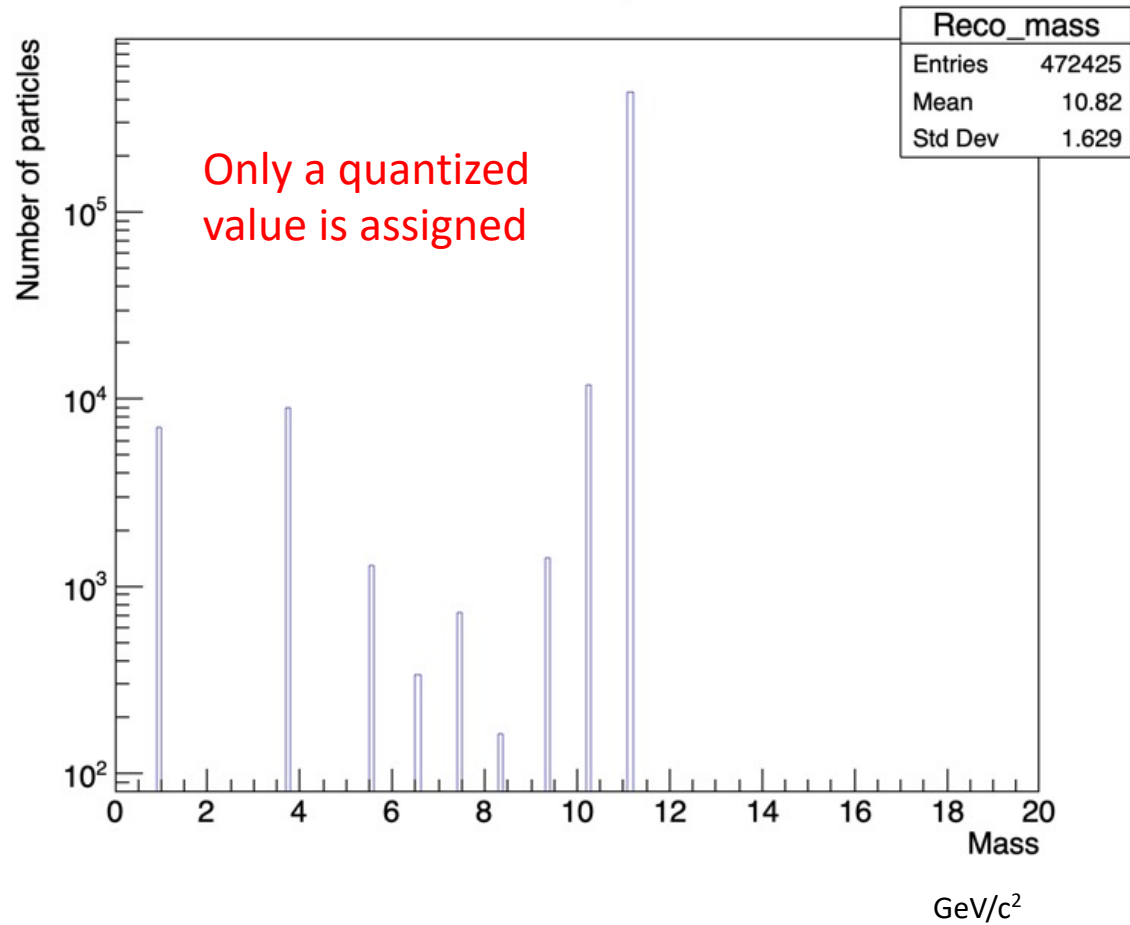

Charge of reco particles

Reconstructed Mass

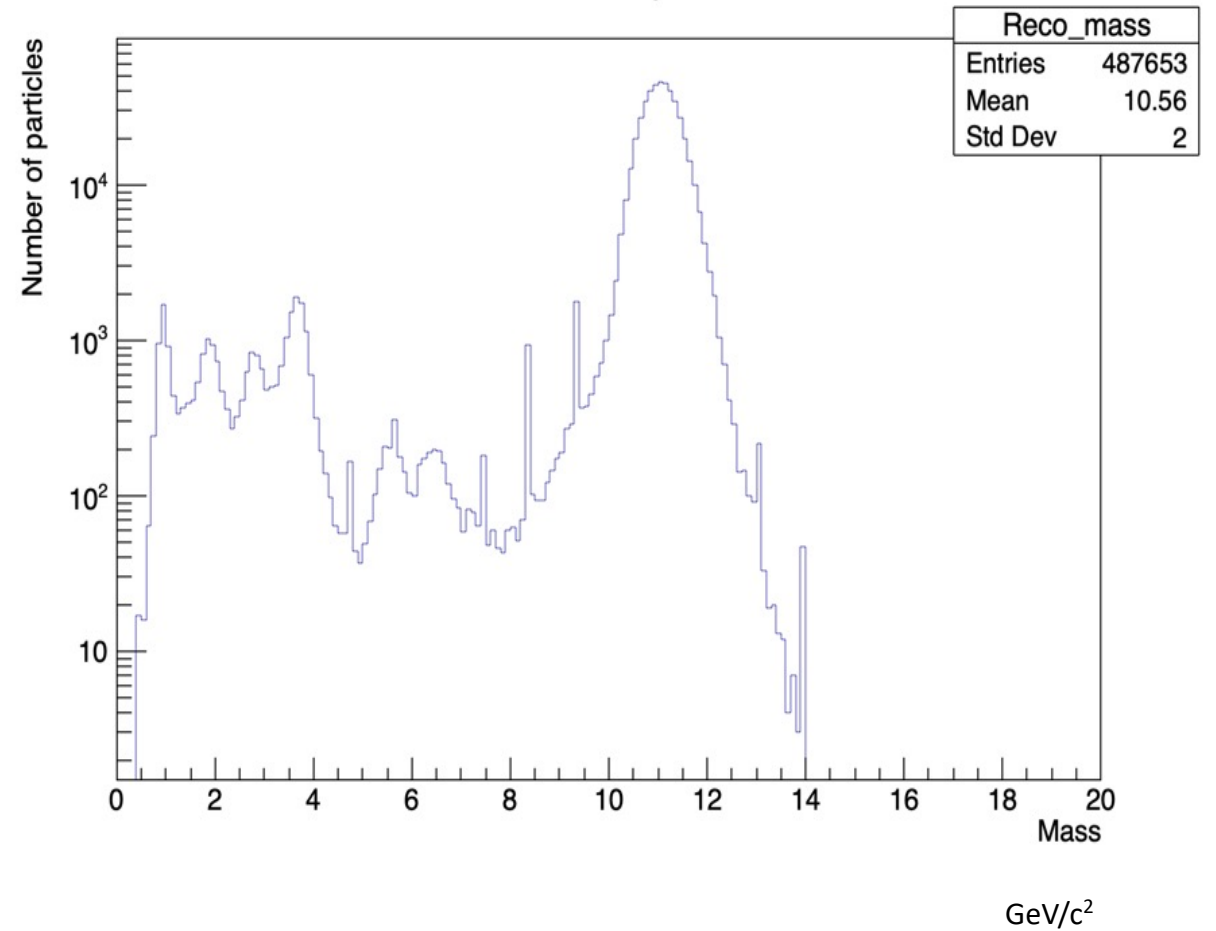

GENFIT

Mass of reco particles

TOE

Mass of reco particles

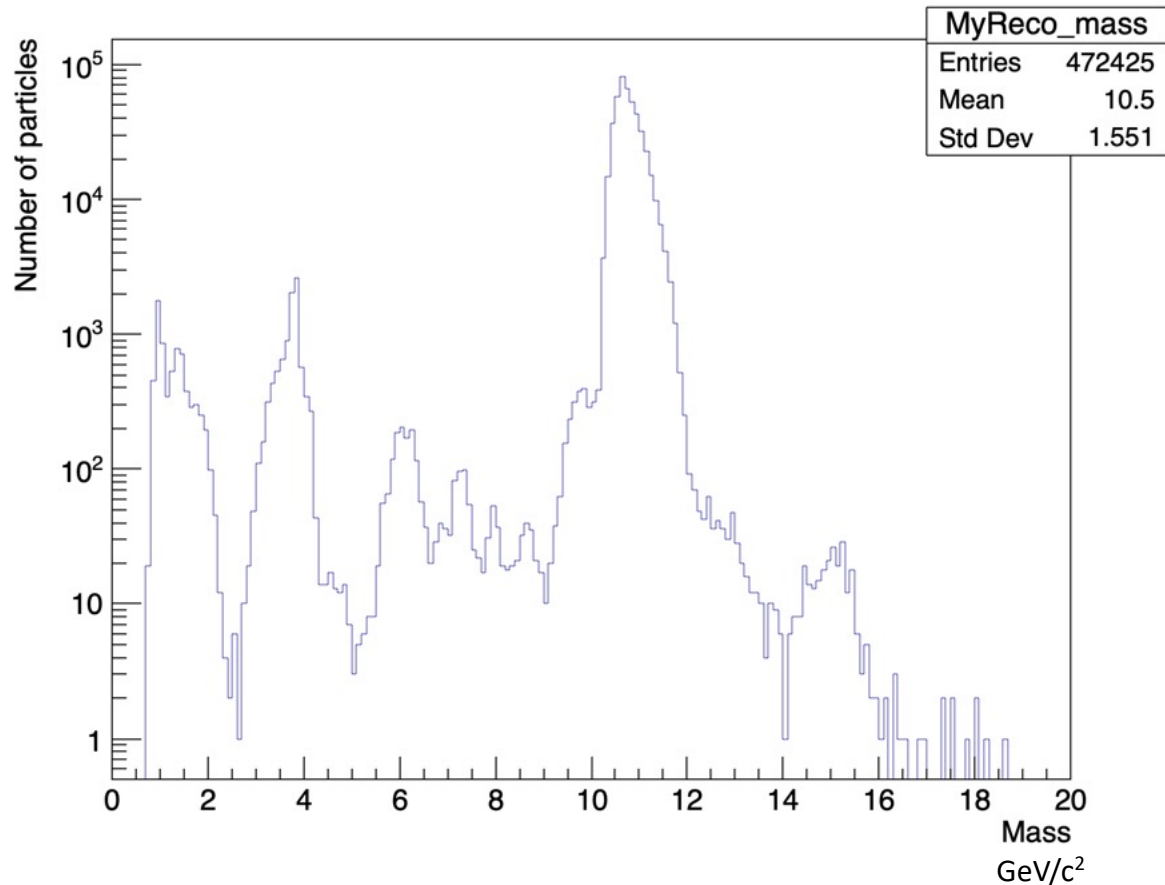

Genfit tries to assign the isotope mass which best fits the reconstructed track

Reconstructed Mass

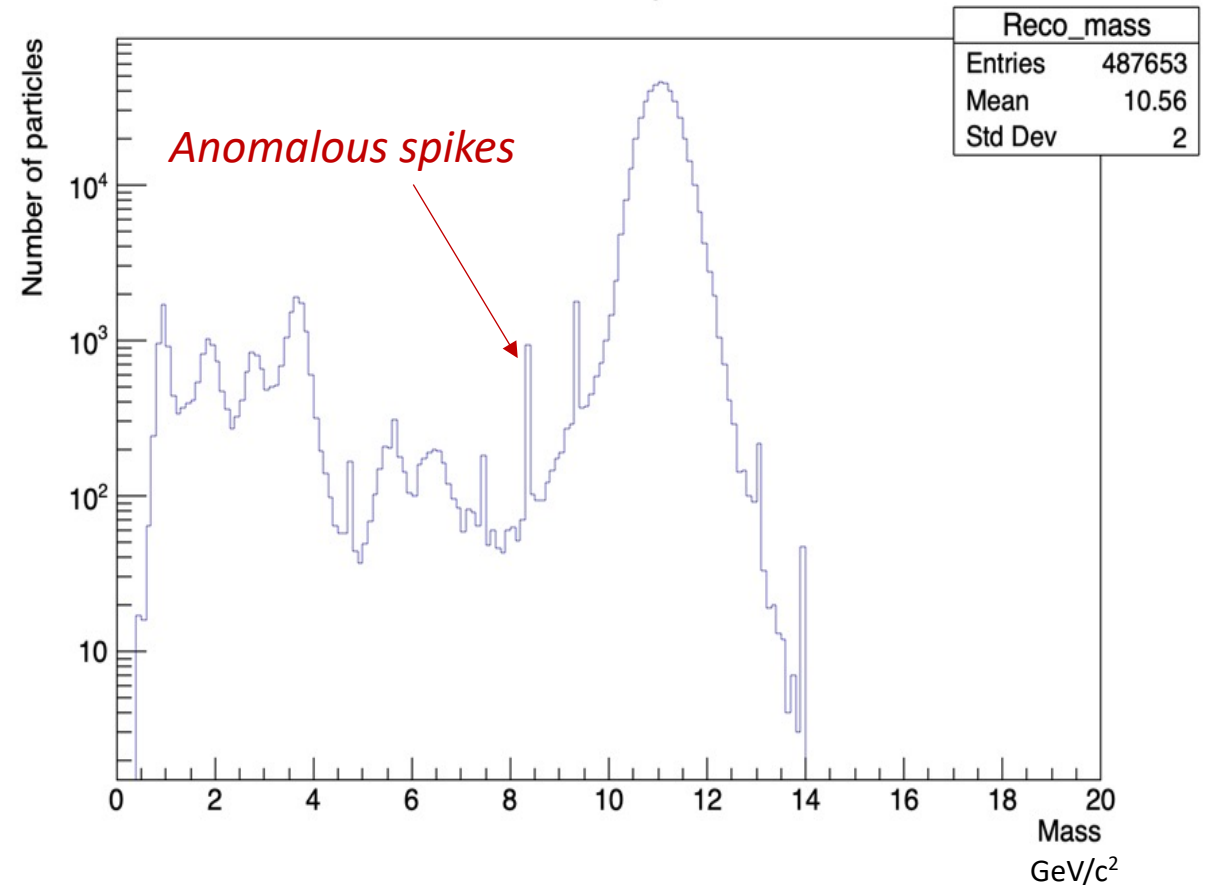

GENFIT

Mass of reco particles

TOE

Mass of reco particles

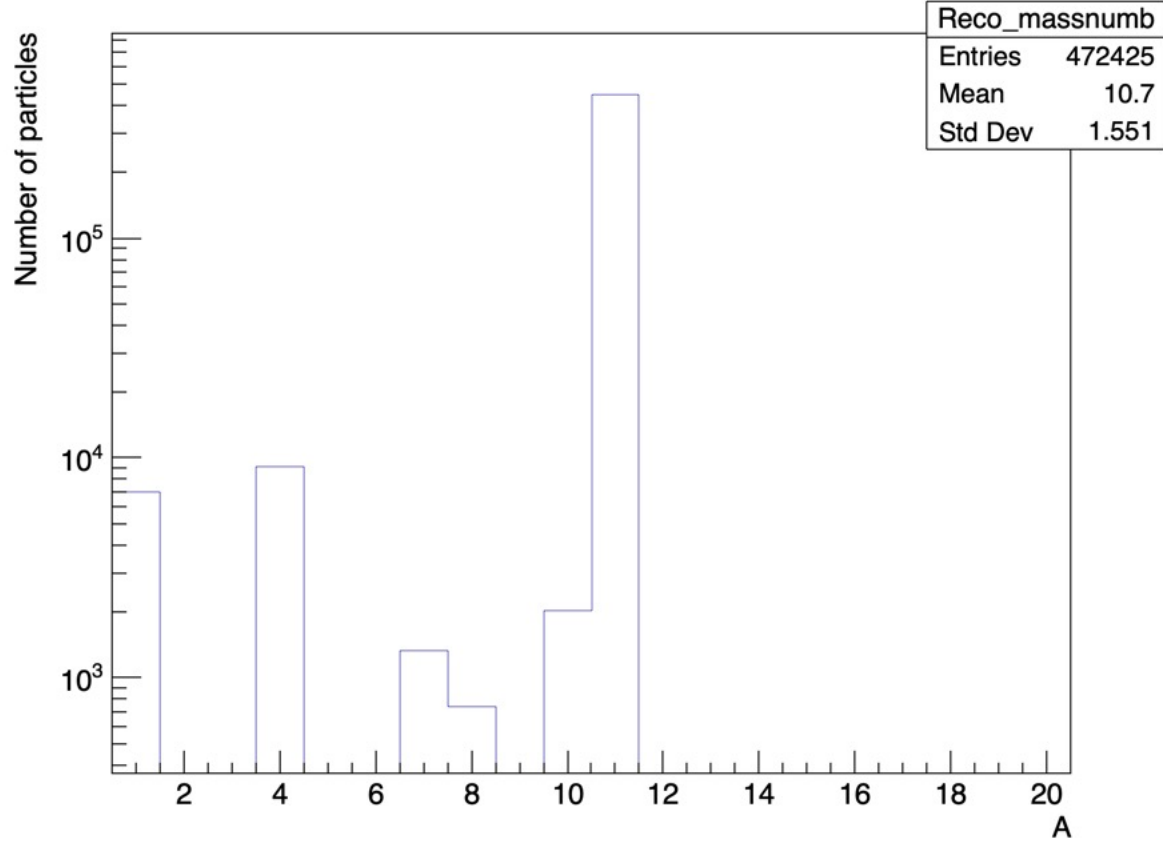

My Mass evaluation in Genfit: I get it by combining P and Lorentz-gamma

Reconstructed A

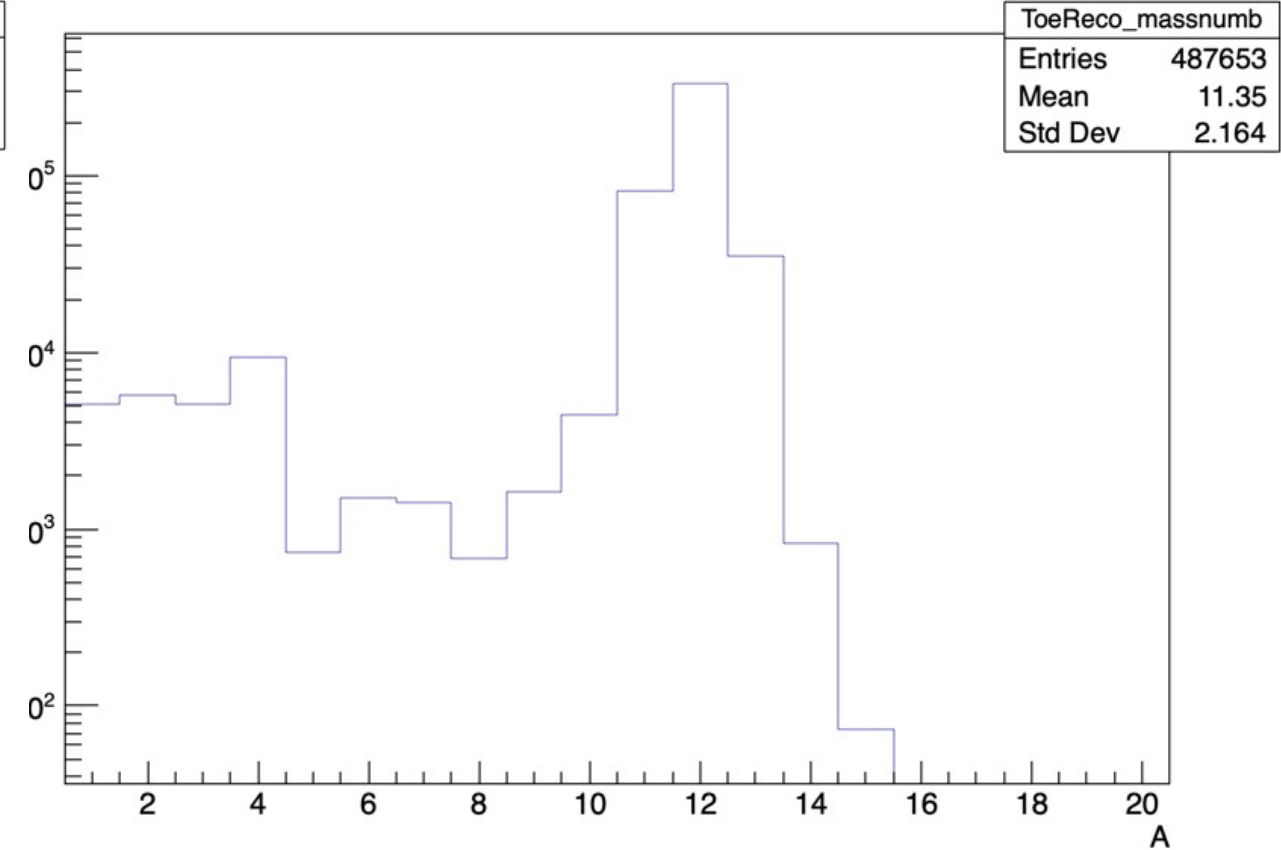

GENFIT

Mass number of reco particles

TOE

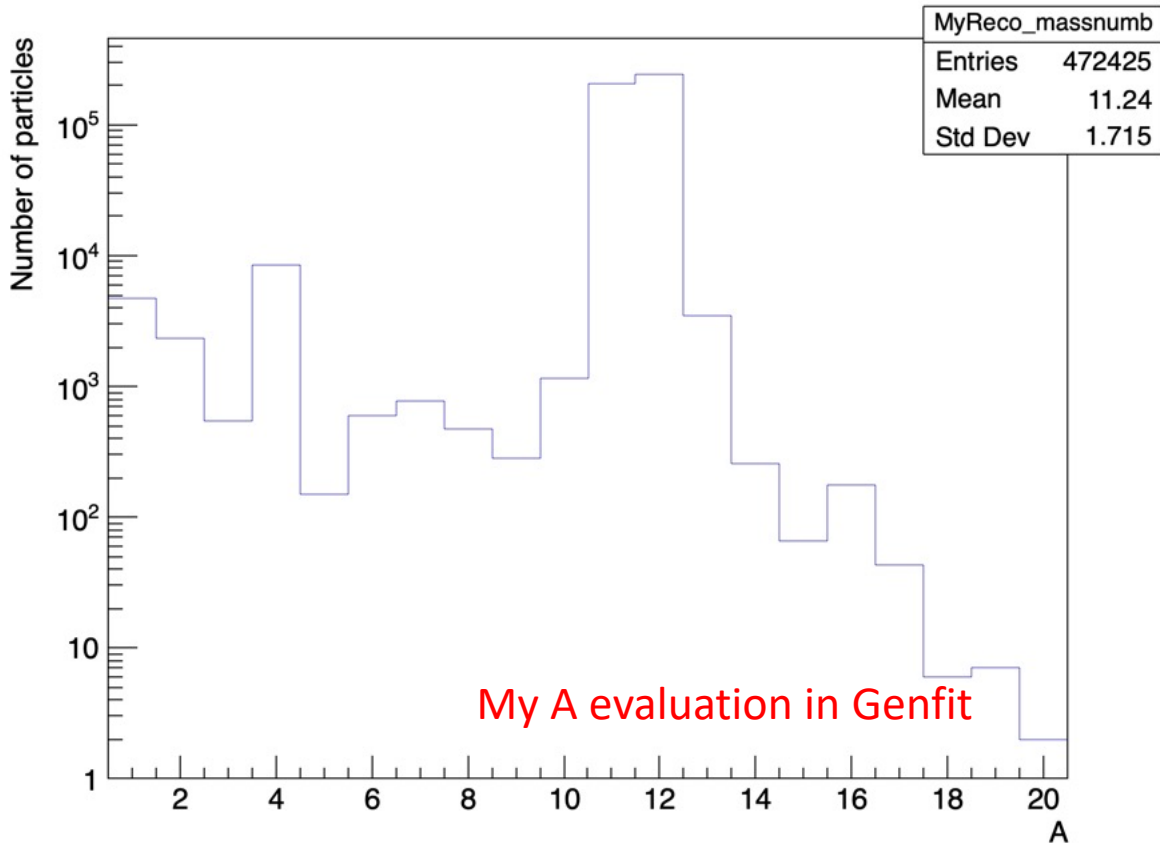

Mass number of reco particles

Reconstructed A

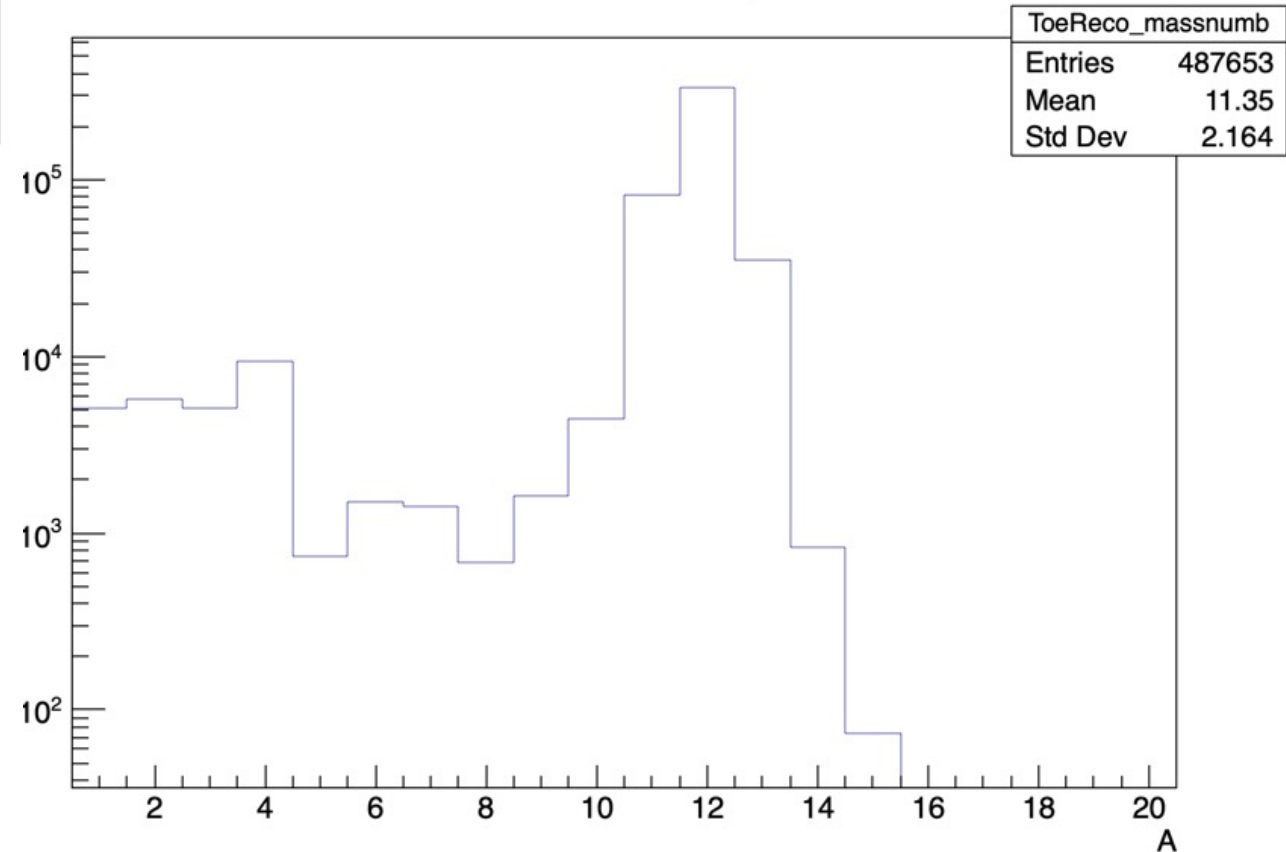

GENFIT

Mass number of reco particles

TOE

Mass number of reco particles

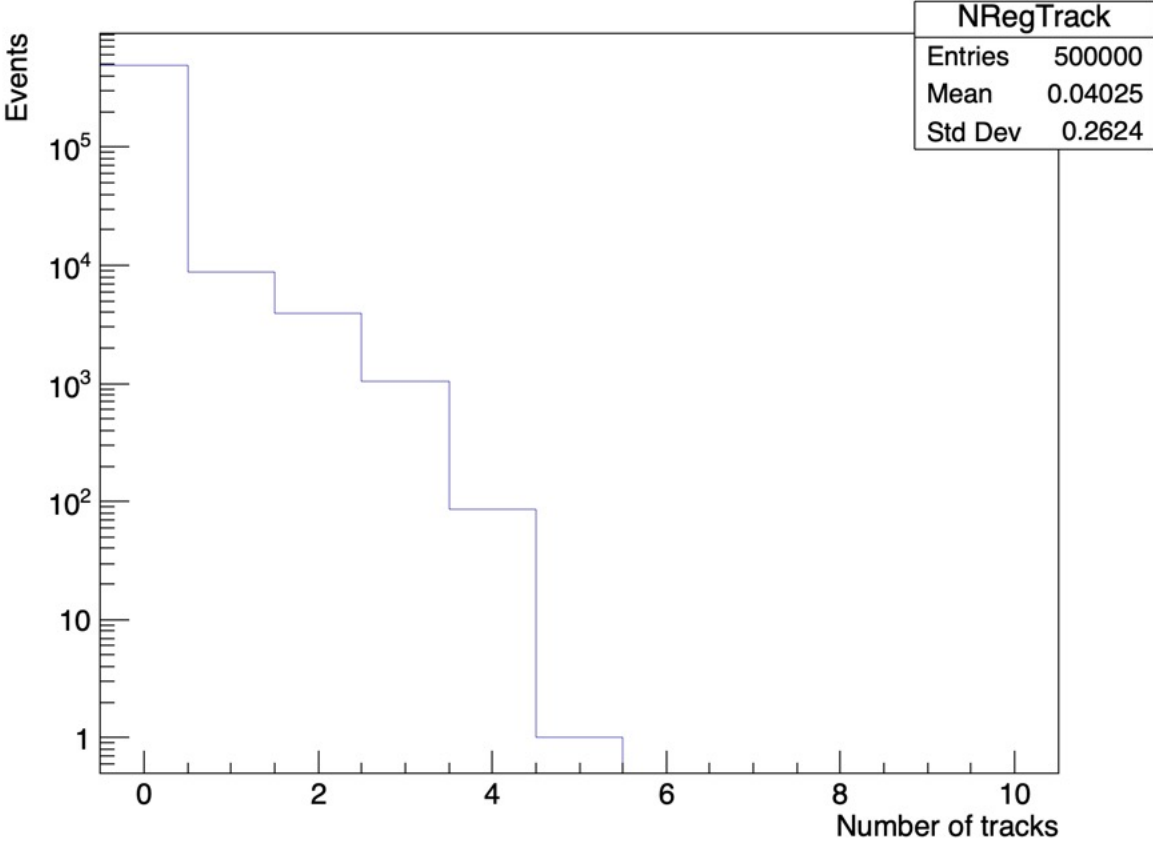

After my mass evaluation I take the closest A, given the reconstructed Z

After matching with MC track: Number of “True” tracks (either real primaries or secondary coming from target)

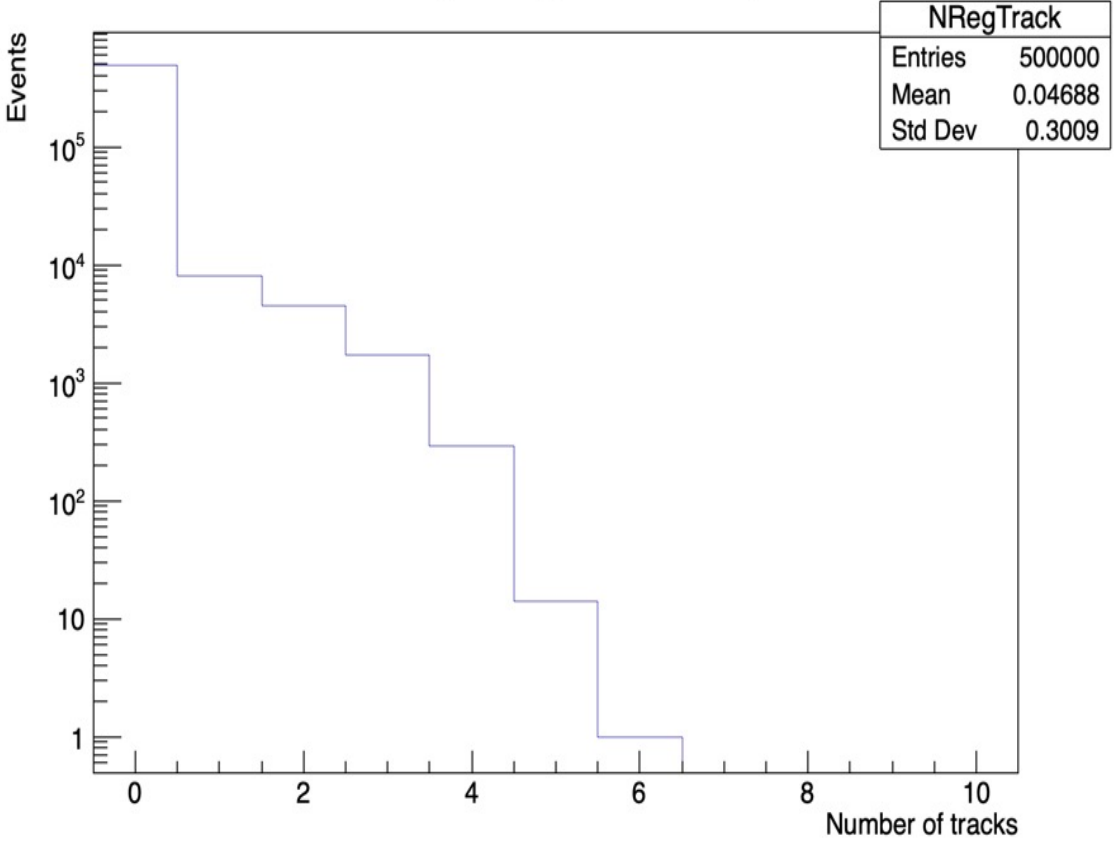

GENFIT

TOE

Number of Reg reco global tracks per event

Number of Reg reco global tracks per event

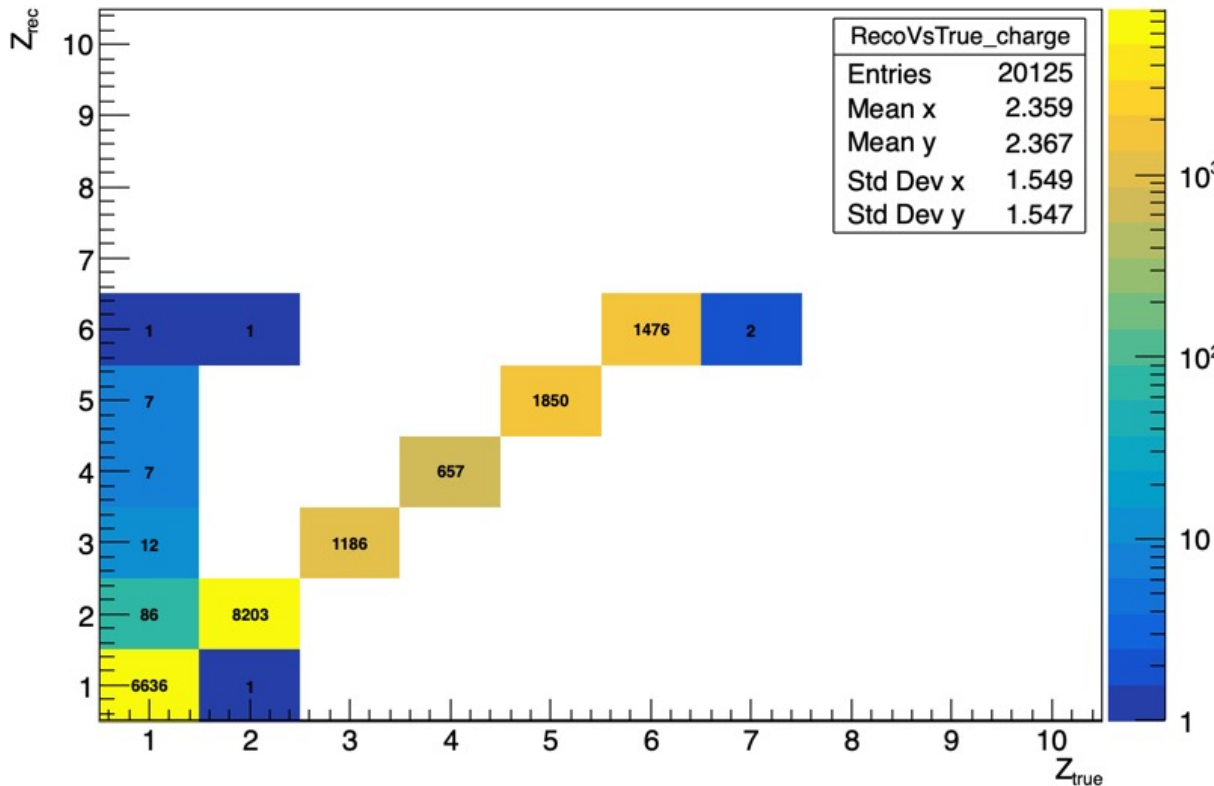

Reconstructed Vs True ChargeZ

Only for MC matched tracks recognized as secondary fragments originated in target

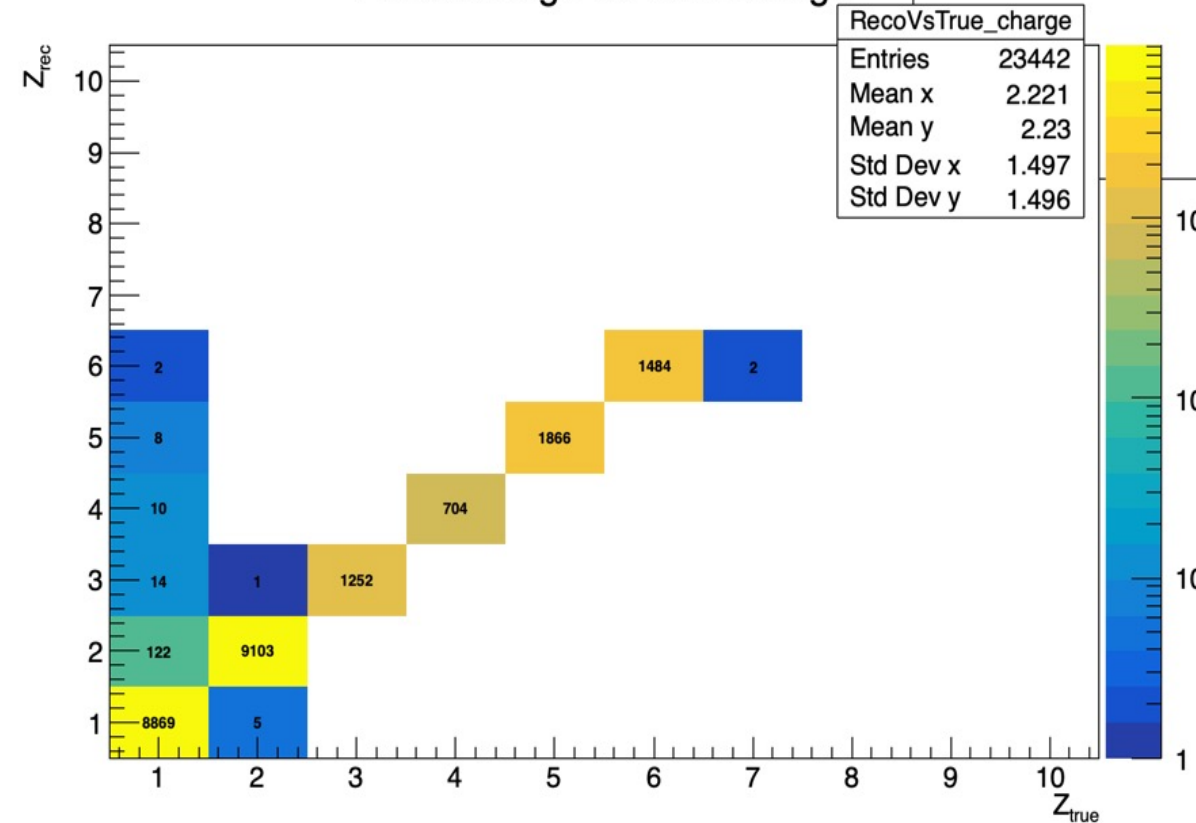

GENFIT

TOE

Reco Charge vs True Charge

Reco Charge vs True Charge

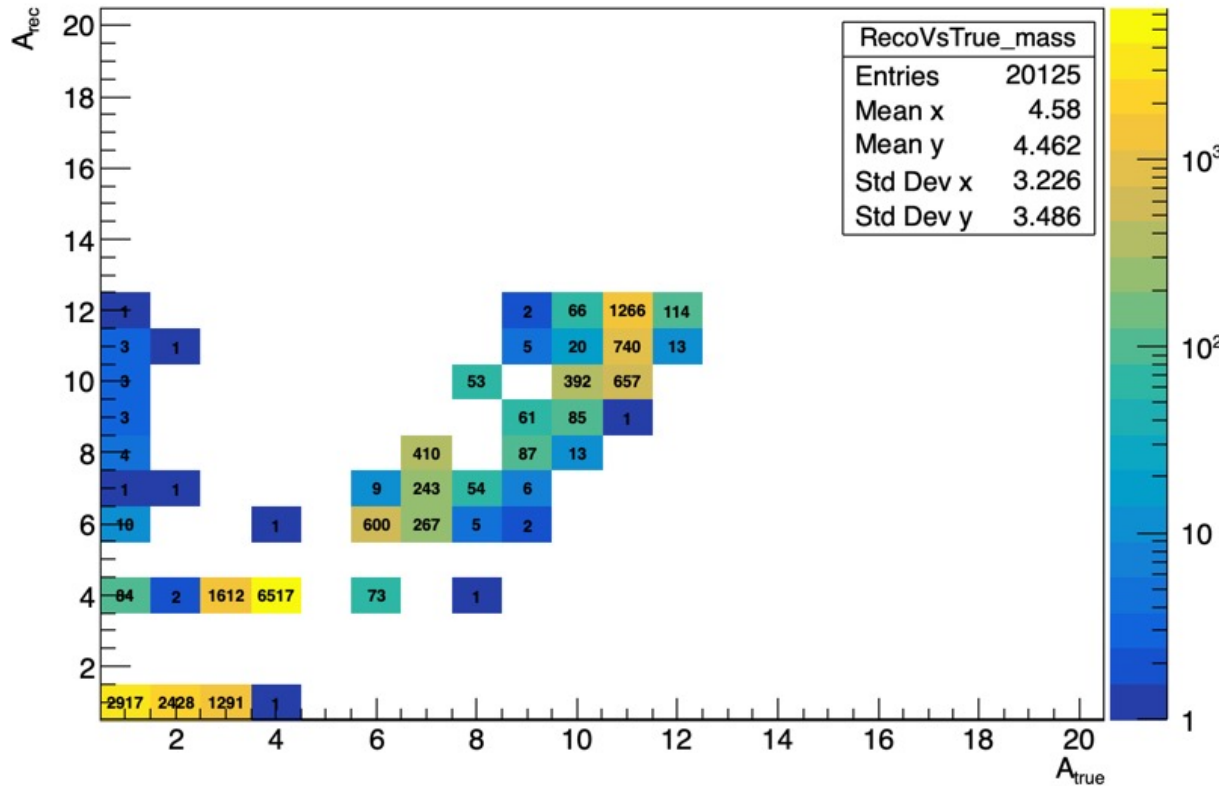

Reconstructed Vs True A

Only for MC matched tracks recognized as secondary fragments originated in target

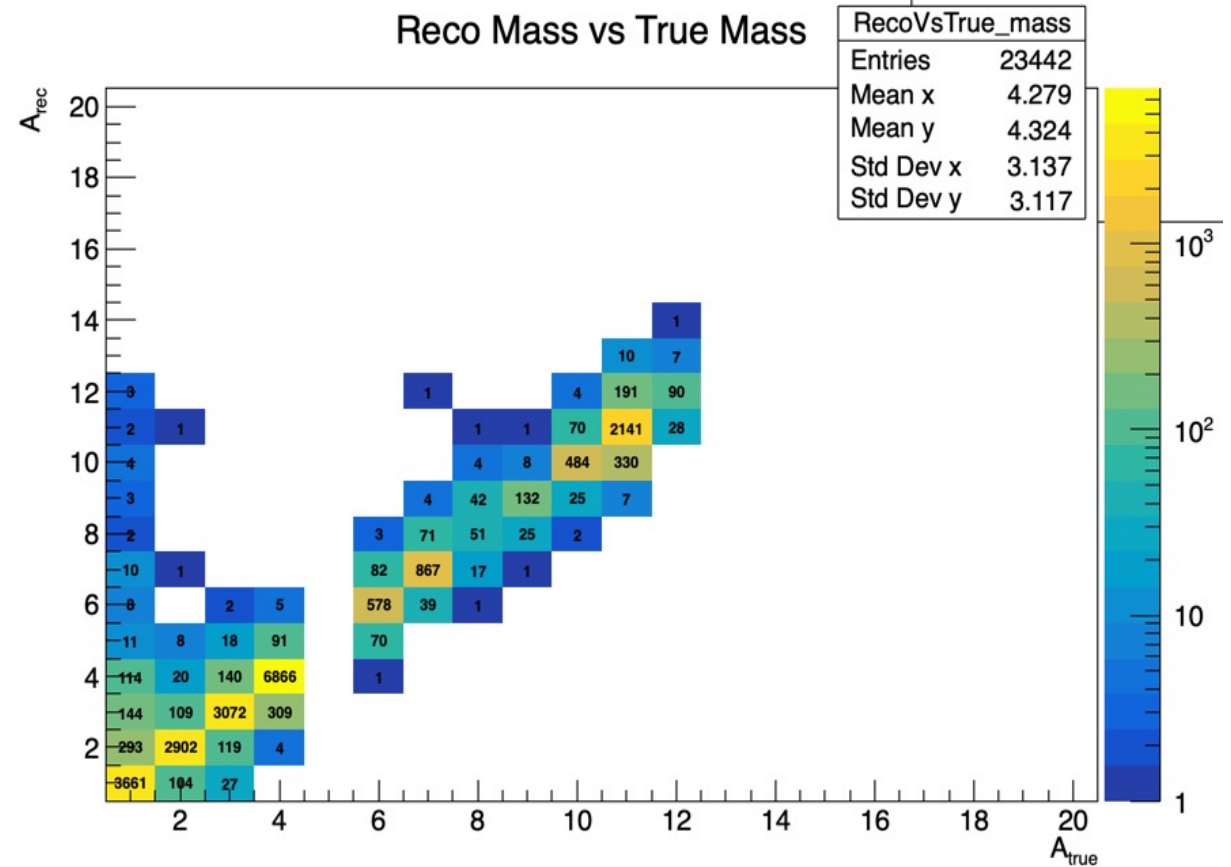

GENFIT

TOE

Reco Mass vs True Mass

Reco Mass vs True Mass

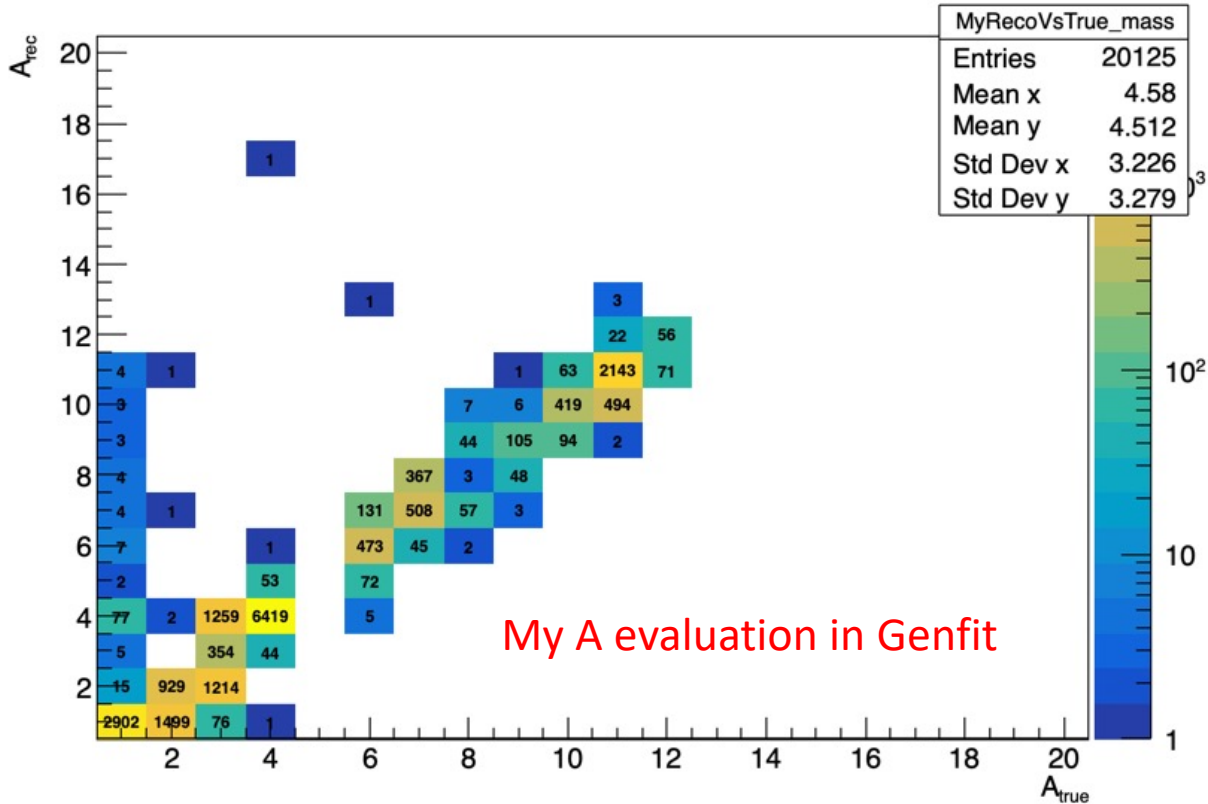

Reconstructed Vs True A

Only for MC matched tracks recognized as secondary fragments originated in target

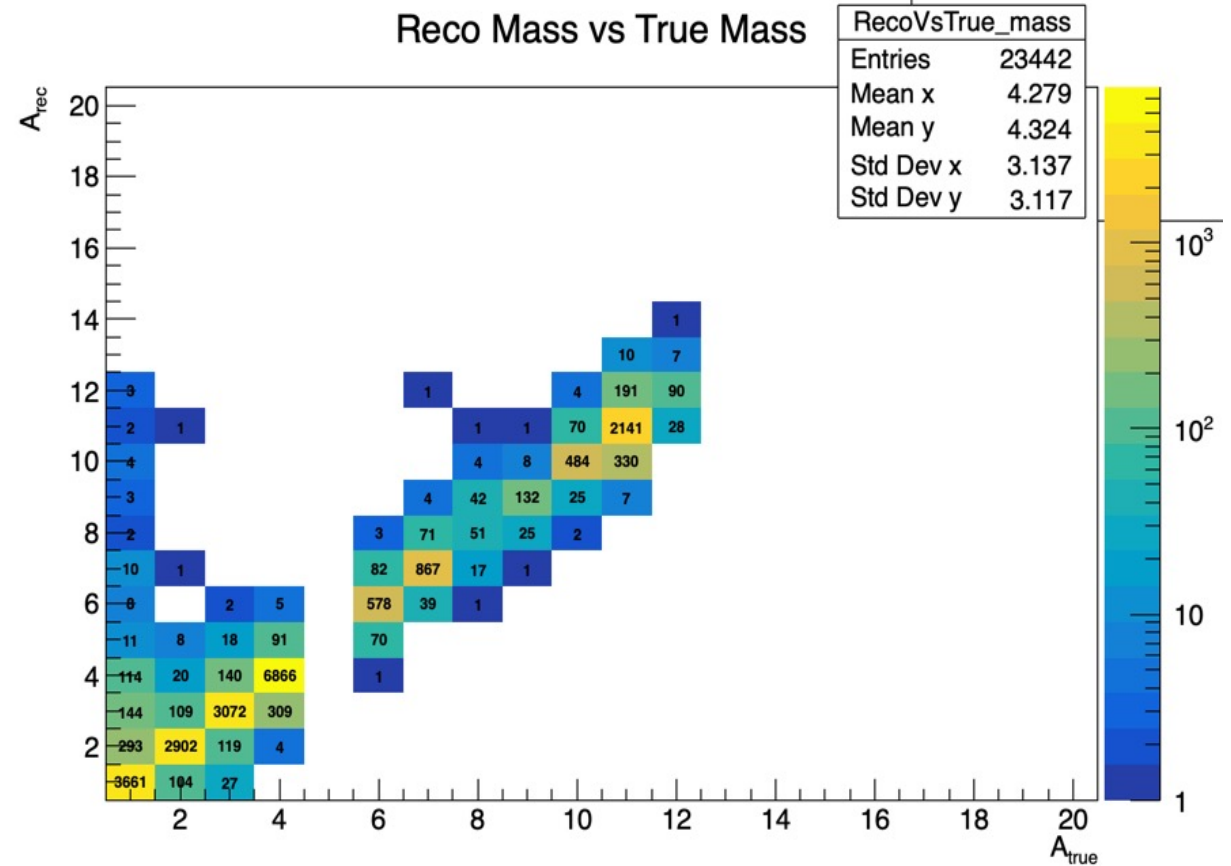

GENFIT

TOE

Reco Mass vs True Mass

Reco Mass vs True Mass

About the matching with MC tracks:

Performed by inquiring which MC track originated the TW point belonging to the reconstructed global track

GENFIT:

N good tracks: 472425

From Target: 20125; from VTX: 90; from MSD: 1; from CAL: 2

Apparently the TW point sometimes is not a good one

TOE:

N good tracks: 487653

?

?

From Target: 23442; from VTX: 327; from MSD: 3268; from CAL: 6
