The Hybrid paradigm

Longitudinal profile

FD - calorimetric measurement
- duty cycle 15%

Density of particles at the ground

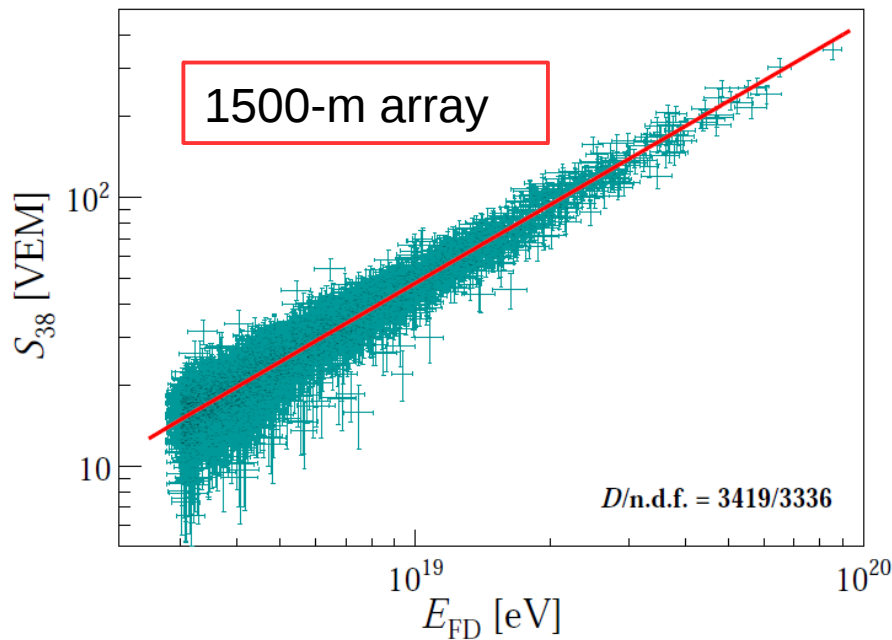

SD - duty cycle $\sim 100\%$

Use the energy scale provided by FD to
calibrate the entire SD data sample

Calibration with the FD energy scale: above 2.5 EeV

Auger Collaboration Phys. Rev. D 102 (2020) 062005

Energy resolution

SD: < 20% (zenith < 60° and $E > 2.5$ EeV)

Hybrid: 6-8 % Hybrid [ICRC 2019]

Important to account for resolution effects in the SD-based spectra

Energy scale uncertainty

Systematic uncertainty in the energy scale

ICRC 2013

Fluorescence yield	3.6%
Atmosphere	3.4% – 6.2%
FD calibration	9.9%
FD profile recon.	6.5% – 5.6%
Invisible energy	3% – 1.5%
Stability of energy scale	5%
TOTAL	14%

Cutoff at $\sim 5 \cdot 10^{19}$ eV confirmed

Ankle at $\sim 5 \cdot 10^{18}$ eV confirmed

new feature instep at $\sim 10^{19}$ eV identified

SD1500, zenith $< 60^\circ$

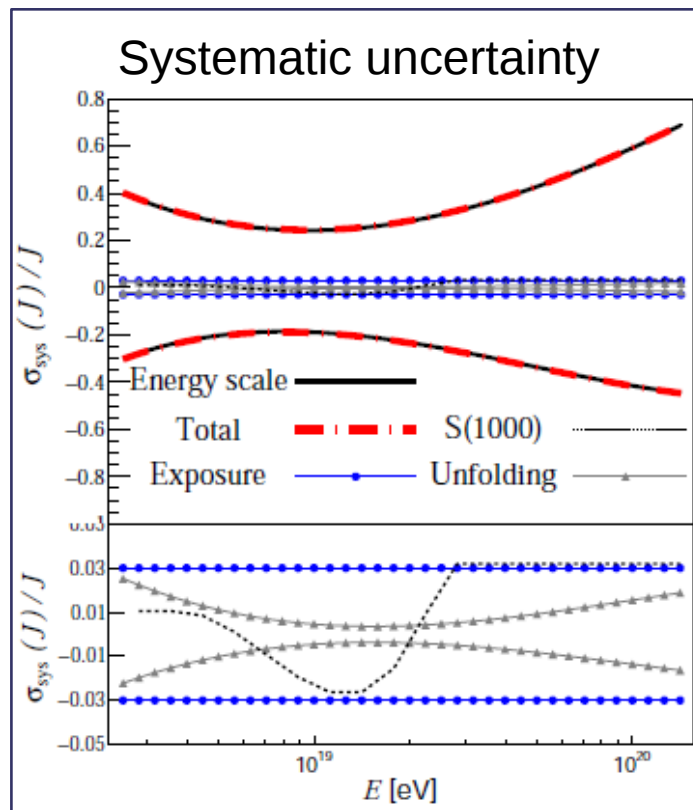

Data sample:

215030 events

1/1/2004 – 31/8/2018

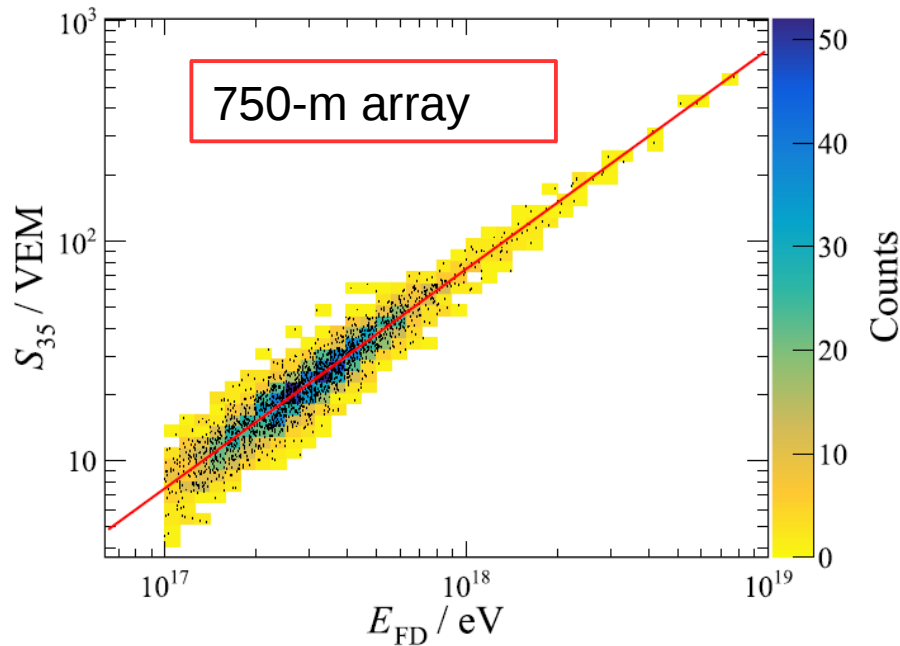

Exposure:

60400 km² sr y

Extending the SD spectrum down to 0.1 EeV

Auger Collaboration Eur. Phys J C. (2021) 81:966

Energy resolution

SD: < 20% (zenith < 40° and $E > 0.1$ EeV)

Hybrid: 6-8 % Hybrid [ICRC 2019]

2nd knee observed

Energy scale uncertainty

Systematic uncertainty in the energy scale

ICRC 2013

Fluorescence yield	3.6%
Atmosphere	3.4% – 6.2%
FD calibration	9.9%
FD profile recon.	6.5% – 5.6%
Invisible energy	3% – 1.5%
Stability of energy scale	5%
TOTAL	14%

The Auger combined spectrum

Five measurements

- more than 3 order of magnitudes
- same energy scale

Fluxes in agreement

within systematic uncertainties

Combined energy spectrum

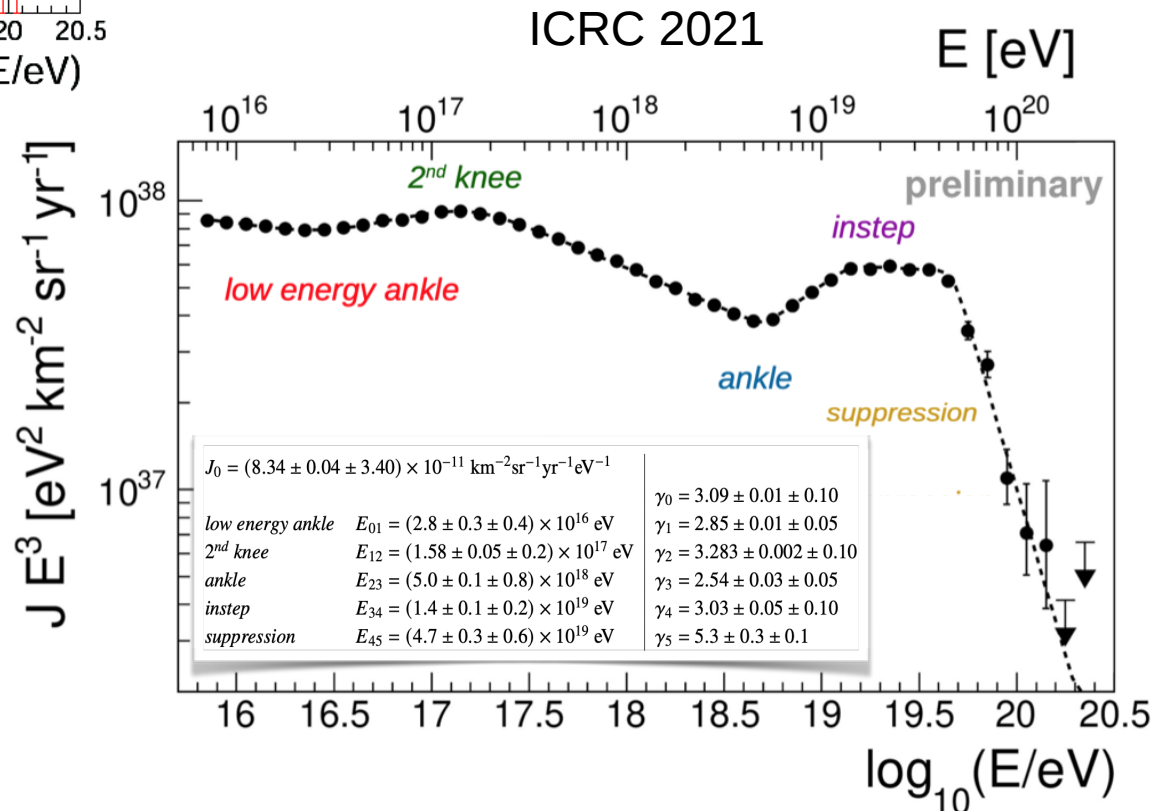

Cutoff at $\sim 5 \times 10^{19}$ eV confirmed

ankle at $\sim 5 \times 10^{18}$ eV confirmed

new feature instep at $\sim 10^{19}$ eV identified

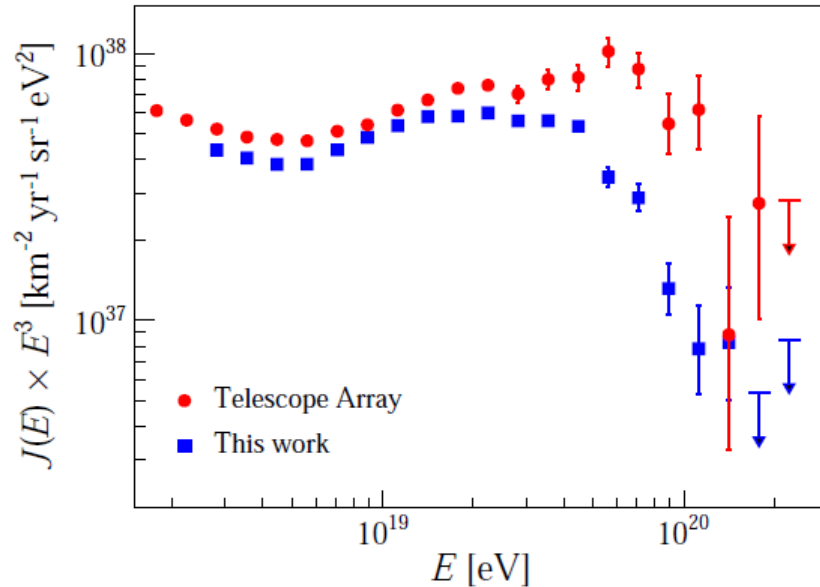

2nd knee observed

Hint for a low energy ankle

AUGER vs Telescope Array

Auger Collaboration Phys. Rev. D 102 (2020) 062005

In agreement at the ankle within energy scale systematic uncertainties (Auger 14%, TA 21%)
Tension at the highest energies

Auger spectrum is not changing with declination, flux compatible with the dipole anisotropy at $E > 8$ EeV

Cross check in the common declination band ($-15^\circ < \delta < 24.8^\circ$): differences substantially smaller than in full-sky comparison but still noticeable, would need further energy-dependent shifts of $\pm 10\%$ /decade to match highest energies

Joint Auger-TA working group working on tracking possible detector systematics

Chemical composition using the FD

ICRC 2019

Xmax syst. uncertainty
 $\sim 10 \text{ g cm}^{-2}$ (20 g cm^{-2} at the lowest energies)

Xmax resolution
 $15 (25, 40) \text{ g cm}^{-2}$
 $E > 10^{19} \text{ eV}$ ($E \sim 10^{17.8} \text{ eV}$, $E \sim 10^{17.2} \text{ eV}$)

- non constant composition, increase of the mean mass above and below $\sim 2 \text{ EeV}$
- interpretation depends on hadronic interaction models

Mass fractions at Earth from fitting templates of 4 mass groups to the measured X_{\max} distributions

Front. Astron. Space Sci. 6 (2019) 23

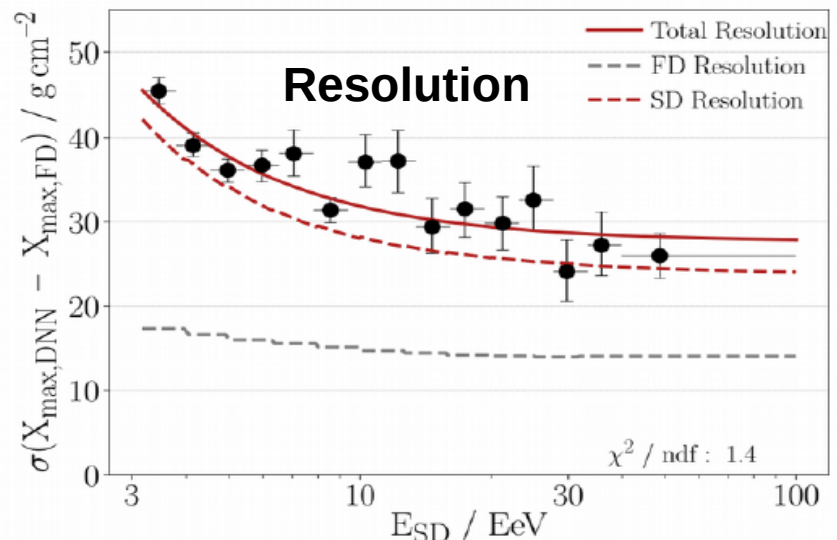

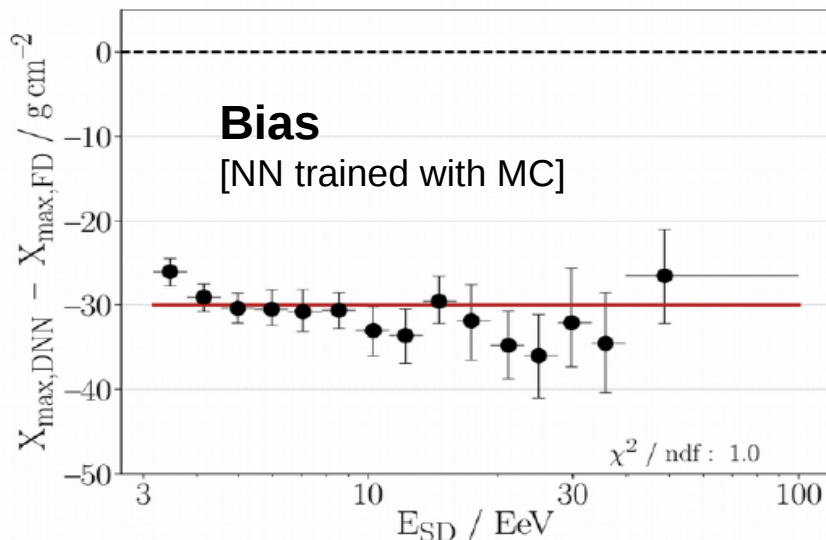

SD can extend the measurement of $\langle X_{\max} \rangle$ (worse resolution)

Neural network approach tested with hybrid events

Promising in view of the additional info provided by the upgraded SD detector

The Pierre Auger Collaboration, JINST (2021) 16 P07019

$\langle \ln A \rangle$ and variance for testing the interaction models

- Model-independent trend in $\langle \ln A \rangle$
- Pure composition excluded below and around the ankle
- QGSJETII04 is in tension with data

ICRC 2019

How well hadronic models match data?

Hybrid events $\sim 10^{19}$ eV, $0^\circ < \text{zenith} < 60^\circ$

PRL 117, 192001 (2016)

Observed longitudinal profile from FD is reproduced by simulations

Measured signal at the ground differ for data and simulations

R_{had} and R_E
Scaling factors to match data

Evidence of muon excess

$$1.3 < R_{\text{had}} < 1.6$$

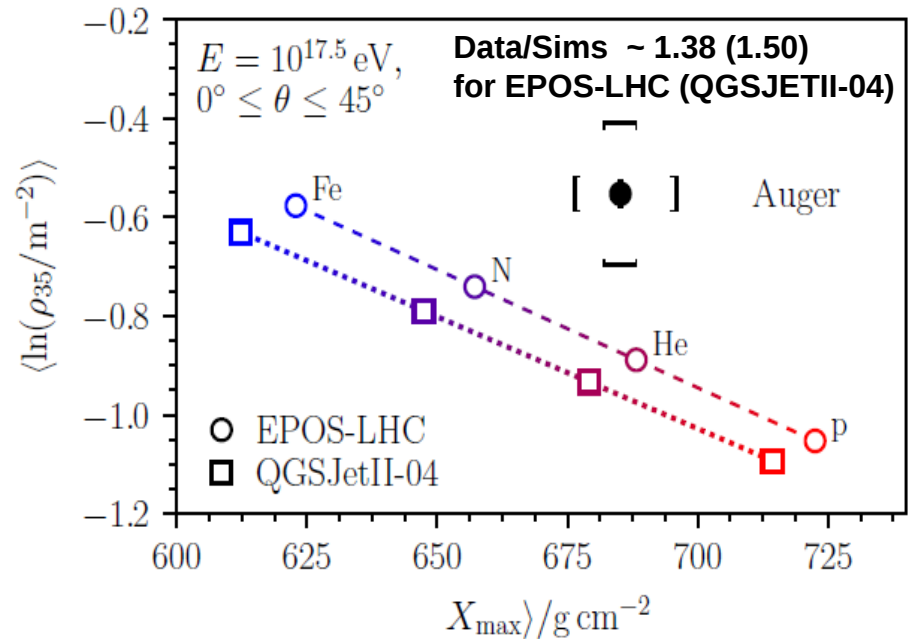

Insensitive to energy scale uncertainty

$$R_E \sim 1$$

Measurement of muon density and impact on models

Eur. Phys J. C (2020) 80:751: first direct measurement of muon number with UMD at Auger

$$z = \frac{\langle \ln x \rangle - \langle \ln x \rangle_p}{\langle \ln x \rangle_{\text{Fe}} - \langle \ln x \rangle_p}$$

**Muon number from models
in tension with data**

Fluctuation in agreement

(Phys. Rev. Lett. 126 (2021) 152002)

Combined fit of Auger data (spectrum and X_{\max} simultaneously) vs astrophysical scenarios

Auger Collaboration Phys. Rev. Lett. 125 (2020) 121106

sources accelerating only
protons → **disfavoured**

uniformly distributed sources
accelerating nuclei [rigidity
dependent] → **favoured**

indication that the new feature at
 10^{19} eV may be due to the interplay
of He and CNO components
(individual nearby source not
favored, spectrum flat in
declination)

additional component required below 5×10^{18} eV (possibly a tail from galactic CR)

energy density in CR above the ankle $(5.66 \pm 0.03 \pm 1.40) \times 10^{53}$ erg Mpc⁻³
this constraints the luminosity density for classes of extragalactic

sources such as AGN and SB match

see A. Condorelli at this Conf.

BEST FIT

- 1) EG: **hard HE component**
+ **soft LE component**
- 2) **possible Galactic component (N)**

Scenarios compatible within systematics

Harmonic analysis in right ascension α

$E > 8 \text{ EeV}$

Exposure=76800 km²sr y

$E \text{ [EeV]}$	events	amplitude r	phase [deg.]	$P(\geq r)$
4-8	81701	$0.005^{+0.006}_{-0.002}$	80 ± 60	0.60
> 8	32187	$0.047^{+0.008}_{-0.007}$	100 ± 10	2.6×10^{-8}

significant modulation at 5.2σ (5.6σ before penalization for energy bins explored)

6 σ with 15% more data → Astrophys. J. 891 (2020) 142

Equatorial coordinates

3D dipole → $(6.5^{+1.3}_{-0.9})\%$ at $(\alpha, \delta) = (100^\circ, -24^\circ)$

dipole direction $\sim 125^\circ$ from GC ➡ disfavors galactic origin

Extragalactic origin favored

Anisotropy at intermediate scale

see L. Caccianiga at this Conf.

The Astrophysical Journal 935 (2022)170

Blind search for overdensities

Energy [32-80] EeV - zenith up to 80°

2635 events between 1/1/2004 and 31/12/2020

Centaurus A region:

most significant excess, 2.2σ post trial, at $\psi \sim 24^\circ$ $E > 41$ EeV
direction fixed at Cen A 3.9σ post trial, at $\psi \sim 27^\circ$ $E > 41$ EeV

Autocorrelation with structures (GC, GP, SGP) not significant

Likelihood test for anisotropy with astrophysical catalogs

Attenuation and relative weight of sources taken into account.

Catalog	E_{th} [EeV]	Ψ [deg]	α [%]	TS	Post-trial p -value
All galaxies (IR)	40	24^{+16}_{-8}	15^{+10}_{-6}	18.2	6.7×10^{-4}
Starbursts (radio)	38	25^{+11}_{-7}	9^{+6}_{-4}	24.8	3.1×10^{-5}
All AGNs (X-rays)	41	27^{+14}_{-9}	8^{+5}_{-4}	19.3	4.0×10^{-4}
Jetted AGNs (γ -rays)	40	23^{+9}_{-8}	6^{+4}_{-3}	17.3	1.0×10^{-3}

Most significant signal at $E_{\text{th}} = 38$ -41 EeV,

$\psi = 23^\circ - 27^\circ$, signal fraction 6-15%

Significance 4σ for SB

3.1σ for jetted AGN

Hybrid and SD photon search

Photon signature

deeper X_{\max} , less muons

steeper LDF and broader signal

Maximum of shower development: X_{\max}

Muon content of the shower (universality): R_{μ}

Deviation from data $\langle LDF \rangle$: gL_{LDF}

rise-time rel. event-wise quantity: g_{Δ}

Upper limits on diffuse photon flux

Ap. J. 933 (2022)125

Strictest limits at $E > 0.2$ EeV

11 candidates > 10 EeV (SD)

22 candidates > 1 EeV (Hybrid)

Targeted search

In coincidence of known sources including CenA and the Galactic Center [UL extrapolating HESS flux]

GW follow-up (4 events)

NO Candidates found

- Top-down model disfavored

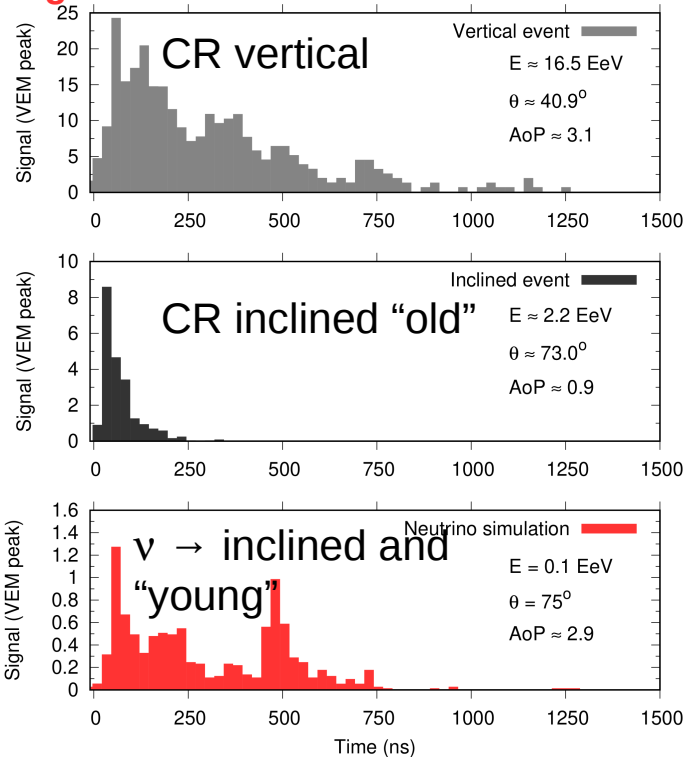

- CR proton dominated scenario (also the most pessimistic cases) disfavoured
- constraining mass and lifetime of dark matter particles → see R. Aloisio at this Conf.
- Auger Phase II: additional information for better photon/hadron separation or photon discovery

UHE neutrinos with the SD

typical signal shapes

signature: distinctive Area-over-Peak

Sensitivity to different channels

ν_τ ES sensitivity dominant

Upper limits on the diffuse neutrino flux

Pierre Auger Coll., JCAP 10 (2019) 022

Identification criteria applied
“blindly” to the search data set

Point-like sources

also in coincidence with observations
by other experiments
For example TXS 0506+056

Coincidence with GW

For example GW170817
GW follow-up (62 events, stack
analysis)

NO Candidates found

NO Candidates found

Maximum sensitivity ~ **1 EeV**

Upper limits set assuming $dN/dE = k E^{-2}$

→ $k \sim 4.4 \times 10^{-9} \text{ GeV cm}^{-2} \text{ s}^{-1} \text{ sr}^{-1} [0.1 - 25] \text{ EeV}$

Heavy constraints on models assuming sources of CR
accelerating only protons with strong evolution in z

Follow-up searches: GW170817

The Astrophysical Journal Letters, 850:L35 (18pp), 2017 December 1

LIGO/Virgo BNS GW170817 & Fermi sGRB 170817A
→ EM counterpart Optical/IR KiloNova AT2017GFO

- excellent visibility of the merger:
90% CL GW event location in FoV of ES channel
- time dependent exposure leads to substantially lower 14-day
neutrino fluence limits wrt to prompt

Auger UHE window: TXS0506

Optimal observation position: source δ in FOV of the Earth-skimming channel (right below the horizon)

→ complementary to IceCube in the EeV range

TXS0506+056 declination = 5.7°
→ Non optimal sensitivity of the source in all channels

Joint searches (UHECR and neutrinos)

Antares, IceCube, Auger, Telescope Array

APJ 934 (2022)164

Three analyses strategies:

- UHECR-neutrino cross-correlation
- Neutrino-stacking correlation with UHECRs
- UHECR-stacking correlation with neutrinos

All compatible with background

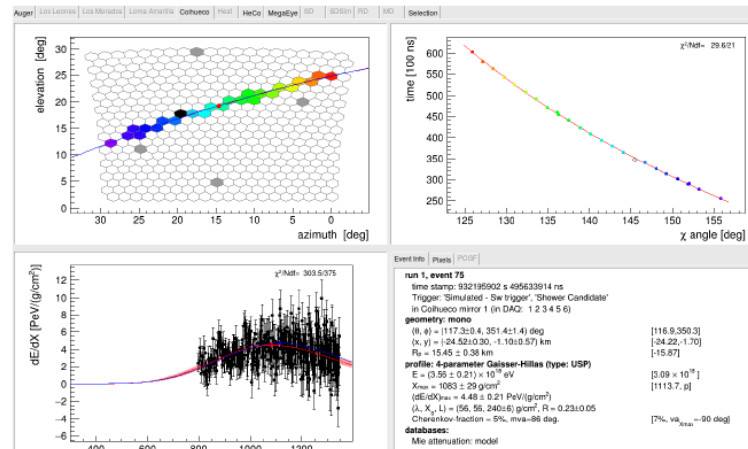

Search for upward-going showers with the FD

Debate triggered after the Observation of the anomalous events by the ANITA experiment

$$E_{1,2} \gtrsim 0.2 \text{ EeV, exit angle } \approx 27^\circ \approx 35^\circ$$

SIGNAL SIMULATION

Zenith [110°- 180°]
log₁₀ (E/eV) [16.5-18.5]

Quantify the sensitivity of the FD to upward-going showers

Use 14 years of FD data (2005-2018) for a dedicated search

BACKGROUND SIMULATION

Downward-going events with specific geometries can mimic upward-going events in a monocular reconstruction

Zenith [0°- 90°]
log₁₀ (E/eV) [17-20]

$$\alpha_1 < \alpha_2$$

$$h_1 > h_2$$

Signal from P₁ reaches the FD before the signal from P₂ → downward-going event reconstructed as upward-going

Also events with a core far away from the array can produce background and need to be simulated

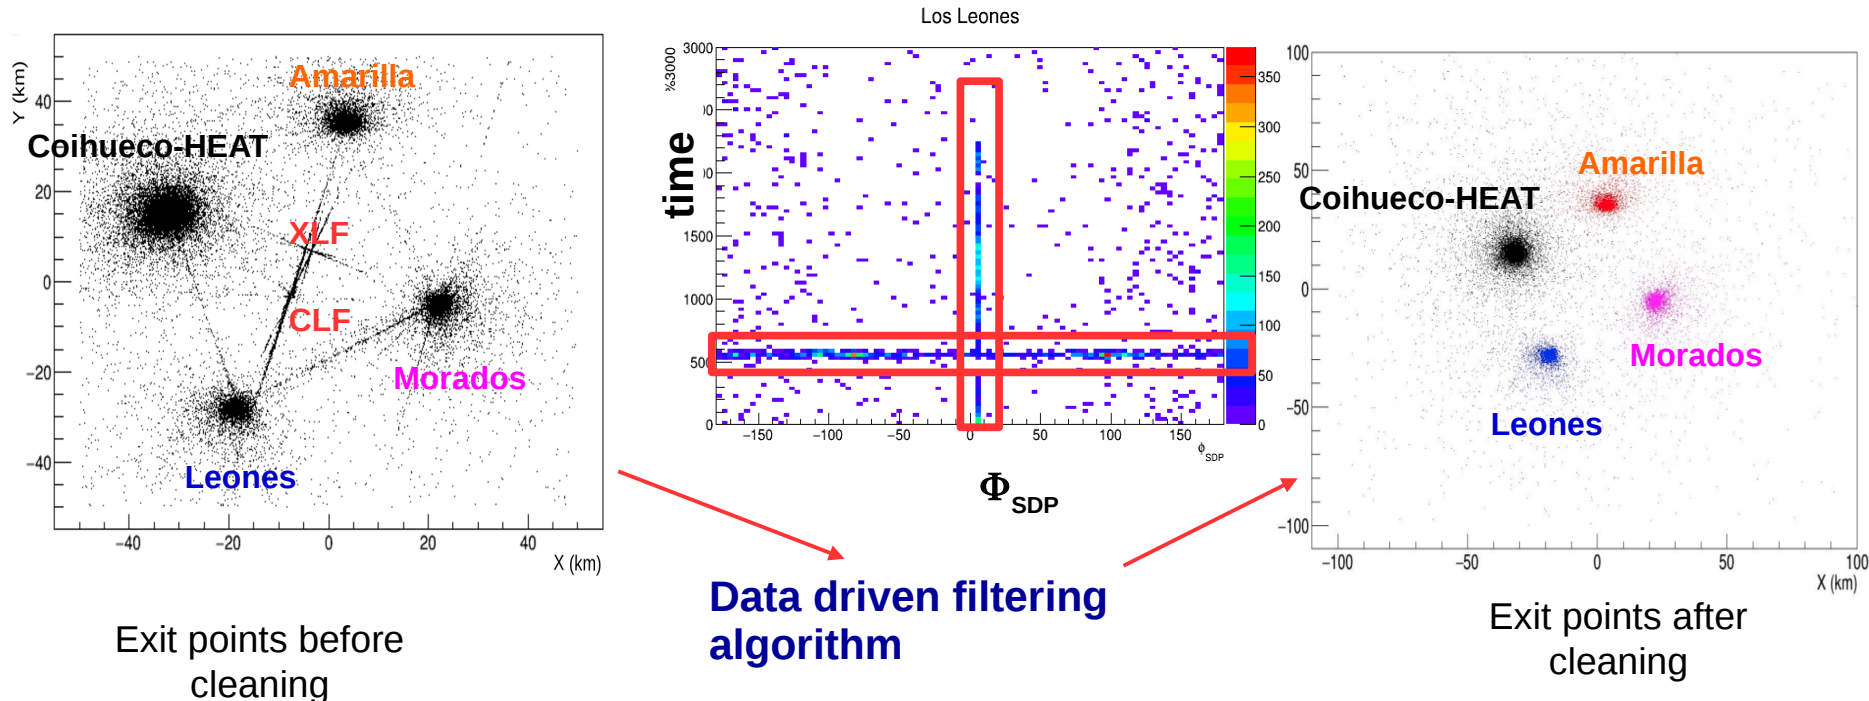

Data cleaning using a burnt data sample

Blind analysis performed using 10% of the FD data from 14 years of FD operation

FIRST STEP: remove untagged laser events used to monitor the atmosphere

Lidar shots have a specific frequency of 333 Hz → they pile up in a GPSSMicroSecond%3000 histogram

CLF and **XLF** have a known position → the angle Φ_{SDP} that define the intersection of the shower detector plane (SDP) with the ground can be used to identify the associated event

Upper limits: upward-going showers with the FD

ICRC 2021

- Variable $l = \text{atan}(-2\log(L_{\text{down}}/L_{\text{up,down}})/50)/(\pi/2)$ defined between 0 and 1

background simulation
weighted to burn
sample \rightarrow good
agreement between
burn sample and
background simulation

$$n_{\text{bkg}} = 0.45 \pm 0.18$$

Upper limits

- $\rightarrow 3.6 \times 10^{-20} \text{ cm}^{-2} \text{ sr}^{-1} \text{ yr}^{-1}$ if exposure is weighted with E^{-1}
- $\rightarrow 8.5 \times 10^{-20} \text{ cm}^{-2} \text{ sr}^{-1} \text{ yr}^{-1}$ if exposure is weighted with E^{-2}

Detector sensitivity over a wide
range of energies and height of
first interaction (zenith $> 110^\circ$)

Useful to test various physics
scenarios (taus, BSM)

Height of first interacti

EAS calorimetric energy

Auger upgrade program: Auger Prime

3.8 m² (1 cm thick) scintillators on each of the main array station

SSD: scintillators sensitive to the electromagnetic content of the shower

SCIENCE CASE

Origin of the flux suppression, GZK vs. maximum energy scenario

Search for a flux contribution of protons up to the highest energies at a level of $\sim 10\%$

Study of extensive air showers and hadronic physics $\sqrt{s}=70$ TeV

- Scintillators **SSD**
- Upgraded and fasterelectronics **UUB** (40 MHz - 120 MHz)
- Extension of the dynamic range with small **sPMT**
- Underground buried **UMD** detectors
- Radio antennas **RD**

4 positions
with 3 UMD
each in the
field

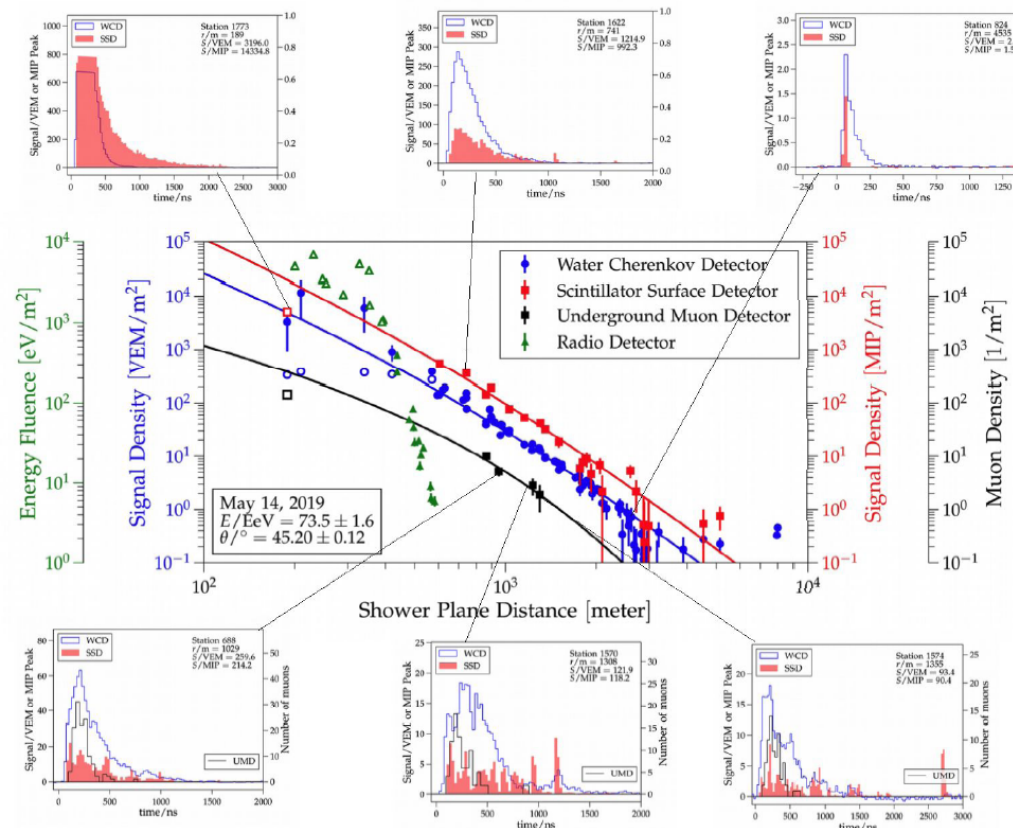

1436 SSD stations deployed

25% of the array equipped with UUB and SSD-PMT and sPMT

Installation completed with UUBs in early 2023

Exemplary “super” hybrid event

Expected exposure
increase and physics
scenarios in reach

Complementary measurements
up to highest energies

Scenario 1 : maximum rigidity

Scenario 2: photo-disintegration

Summary and perspectives

Spectrum	Combined measurements, ankle observed at about $5 \cdot 10^{18}$ eV, new feature at $\sim 10^{19}$ eV, suppression at $E > 4 \cdot 10^{19}$ eV), its nature still not fully understood
Composition	heavier with increasing energy (interpretation is model dependent).
Neutrals	flux photon limits above 0.1 EeV (top-down models disfavored, standard astrophysical sources expected). Absence of cosmogenic neutrinos disfavor pure proton composition
Models	Observed mismatch data models for muon content
Astronomy	Indication of a possible anisotropy at intermediate scale and evidence of dipole at large scale (and $E > 8$ EeV)

Uniformly distributed sources accelerating nuclei (rigidity based scenario) favoured

AugerPrime	<ul style="list-style-type: none">- need composition data $E > 40$ EeV to better understand the suppression- better understanding of hadronic interaction models- separate a light component pointing back to astrophysical sources
------------	---

BACKUP SLIDES

AUGER vs Telescope Array

Auger data folded with TA acceptance are in agreement with TA data

Joint Working Group (arXiv:1503.07540)

Auger&TA working group, JPS Conf.Proc. 9 (2016) 010016
Auger&TA working group, EPJ Web of Cons. 210 (2018) 010009

TA data consistent with Auger-mix composition at least up to 10 EeV at least up to 10 EeV but also with 100% protons, due to larger uncertainties

Large scale anisotropy confirmed **15% more data**

3D dipole $6.5\%^{+0.013}_{-0.09} \rightarrow 6.6\%^{+0.012}_{-0.08}$

Modulation $2.6 \cdot 10^{-8} \rightarrow 1.9 \cdot 10^{-9}$ (**6 σ**)

Study of the energy evolution of the dipole equatorial component and phase

Amplitude increases from 1% to 10% above few EeV

Phase shifts from GC to the opposite at the highest energies

Transition to extragalactic above few EeV

Hybrid and SD photon search

Hybrid selection: Fisher response

Maximum of shower development: X_{\max}
 Muon content of the shower (universality): F_{μ}

SD selection: PCA transformed

Deviation from data $\langle LDF \rangle$: gL_{LDF}
 rise-time rel. event-wise quantity: g_{Δ}

Targeted searches

Pierre Auger Coll., ApJL 837: L25 (2017)

- focus on **12 target sets** (364 candidates sources)
- stacked analysis

→ complement targeted neutron searches

NO evidence for *nearby* photon-emitting *steady* sources in the EeV range

→ PS limits constrain the continuation of measured TeV fluxes to EeV energies

Auger TXS flux limits

Reference flux for 1 event @ Auger

Pierre Auger Coll., Ap. J., 902:105 (2020)

Single flavor

ν 0.5 yr around IC170922A

ν full data set 2004-2018

γ 0.5 yr around IC170922A

UHE neutrinos: point sources sensitivity

Pierre Auger Coll., JCAP 11 (2019) 004

→ sensitivity strongly depends on source location and event timing

point sources transit through the field of view of each detection channel

- good sensitivity in the EeV range in a broad range of declinations
- complementary energy range: $10^{17} \div 2 \cdot 10^{19} \text{ eV}$

GW follow-up (stacked): ν and γ searches

PoS(ICRC2021)968, paper in prep.

No UHE-neutrino events found for 62 GW events
upper limit on neutrino emission (1-day):
 $E_\nu < 6 \times 10^{51}$ erg
→ well below the radiated GW energy

PoS(ICRC2021)973, paper in prep.

Photon Horizon ~ 10 Mpc
→ sources are required to be nearby and well localised
No coincident photon candidate identified
upper limits on spectral fluence (1 day)

A specific case: the tau scenario

PoS (ICRC2021) 1145

Tau propagation --> NuTauSim

J. Alvarez-Muñiz et al., Phys. Rev. D 97 (2018) 023021

Tau decay → Tauola

M. Chruszcz, et al. Comput. Phys. Commun. 232 (2018) 220

main decay branches considered

e^{\pm} , π^{\pm} , π^0 , K^{\pm} , K^0 , contributing to the formation of air showers.

Dmin set by the tau range in standard rock

Dmax set by the FoV of the FD

Channel **3** and **5** are producing air showers within the field of view of FD

Height of first interaction H1 derived from average of the first interaction depth of each secondary, zenith and atmospheric profile

Folding the FD response with taus in FOV

H_1 → height of first interaction

E_{sh} → energy of the induced shower

Selection criteria and energy range inherited from the generic search

FD detector acceptance for generic upwards-going EAS

Observable events

Exposure for different zenith bands

$\lg E < 18.5$ increasing detector efficiency with energy mitigated by the lengthening of tau decay length

$\lg E > 18.5$ FD response not explored yet (flattening is a reasonable assumption)

Differential upper limits

1 event observed, 0.5 expected

$$\Phi_{\tau}^{95\%}(E_0) = \frac{N_{\text{FC}}(E_0)}{\mathcal{E}_{\tau}(E_0)}$$

Two injection spectra

(a) $\Phi_{\tau} \propto E_0^{-1}$

(b) $\Phi_{\tau} \propto E_0^{-2}$

Better limits for inclined events

p-air cross-section

Lower energy $[457 \pm 18(\text{stat}) + 19/-25(\text{syst})]$ mb

Higher energy $[486 \pm 16(\text{stat}) + 19/-25(\text{syst})]$ mb

Sys uncertainty: method, models, helium contamination

Auger: education.....
