

Operation of Cs₂Te in SRF-gun for ELBE

Rong Xiang on behalf of the SRF Gun Group

20-22. Sep. 2022, EWPAA 2022, Milano

Outline

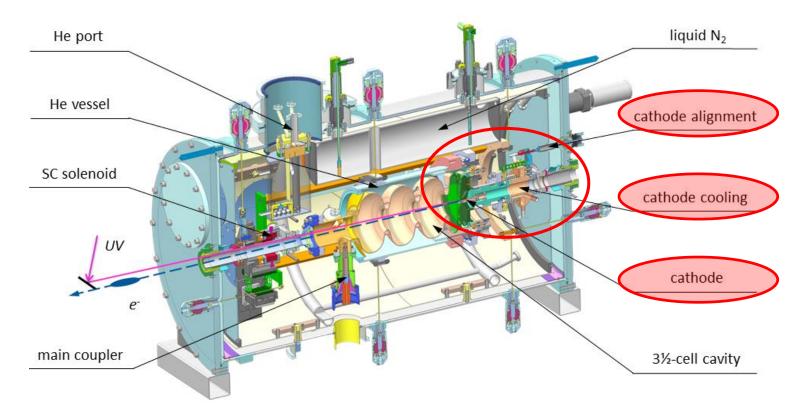

- 1. Introduction of SRF gun-II and ELBE
- 2. Cs₂Te photocathodes for SRF gun-II
- 3. Cathode QE evolution during operation
- 4. Summary and outlook

1. Introduction of SRF gun-II and ELBE

parameters of SRF Gun-II in operation

 $E_{acc} = 8 \text{ MV/m CW } (20 \text{ MV/m peak field on axis})$

E_{cathode}=12 MV/m (field on cathode)

 $I_{dark} \sim 110 \text{ nA } @8 \text{ MV/m}$

4 MeV kinetic energy, bunch charge < 0.4 nC

1. Introduction of SRF gun-II and TELBE

	Milestones of SRF Gun-II		
Jun. 2010	cavity manufacture finish in JLab		
Aug. 2014	commissioning at HZDR		
Feb. 2015	first CW beam with Cu cathode		
Mar./Jun. 2017	Cs ₂ Te (Mo) cathodes overheated in gun		
Since 2017	User operation with Mg		
Since May 2020	User operation with Cs ₂ Te (on Cu plug)		

HIGHLIGHTED ARTICLES

Editors' Suggestion

Successful user operation of a superconducting radiofrequency photoelectron gun with Mg cathodes

1. Introduction of SRF gun-II and TELBE

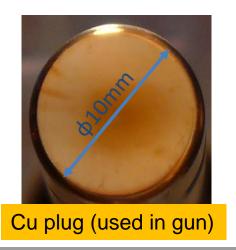

- metallic cathodes or semicondcutor cathodes
- cathode cooling by LN2 to 77 K
- cathode transfer into the cold gun
- therm. and electrical isolation, DC bias up to 7 kV to suppress MP
- moveable (±0.6 mm) by remote stepper for best RF focusing

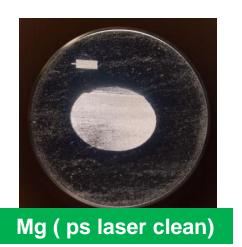

1. Introduction of SRF gun-II and TELBE

Cathodes applied in SRF Gun-II

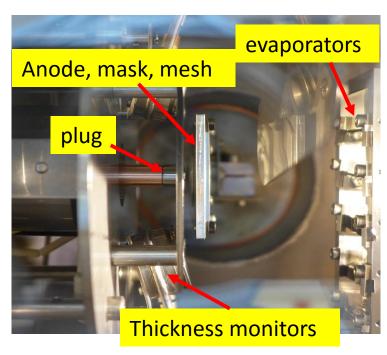

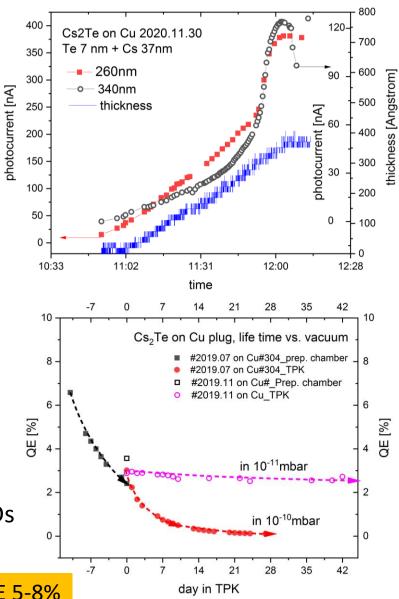

2. Cs₂Te photocathodes for SRF gun-II

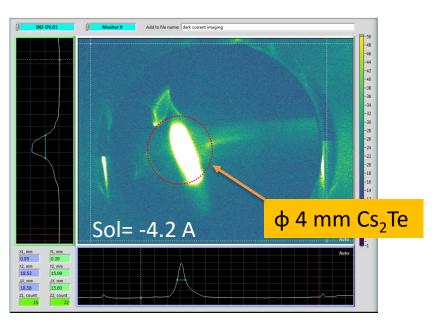

- Polished or diamond turned Cu plug
- baking 350°C before preparation
- Te deposition + Cs activation @ 120° C
- till max photocurrent with 260/340nm LEDs
- storage in transport chamber 10⁻¹¹mbar

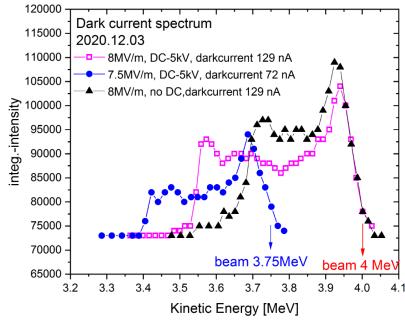

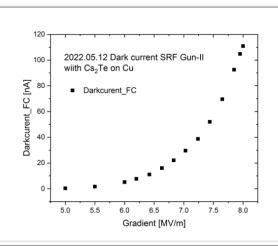

Typical fresh QE 5-8%

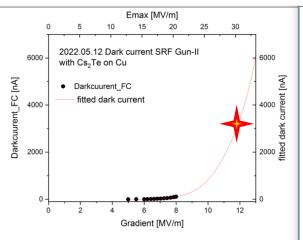

2. Cs₂Te photocathodes for SRF gun-II

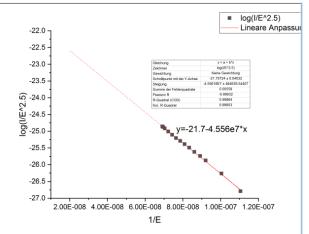

Dark current ~ 120 nA @ 8 MV/m (Screen/FC 1 m from cavity exit)

3. Cathode QE evolution during operation

Cathode No.	Time in gun	Beam time	Extract Charge	
Cs ₂ Te #2021.06.11_7nm	2021.07 ~ 2021.09	492 h	15.3 C	
Cs ₂ Te #2021.06.09_10nm*	2021.09 ~ 2021.12	529 h	16.9 C	
Cs ₂ Te #2021.06.07_8nm	2022.01 ~ 2022.03	262 h	7.1 C	
Cs ₂ Te #2021.10.05_6nm	2022. 03 ~ 2022.09	~ 840 h	~ 29 C	

Status: stable operation

3. Cathode QE evolution during operation

Another problem: several cathodes showed inhomogenous QE distribution during operation.

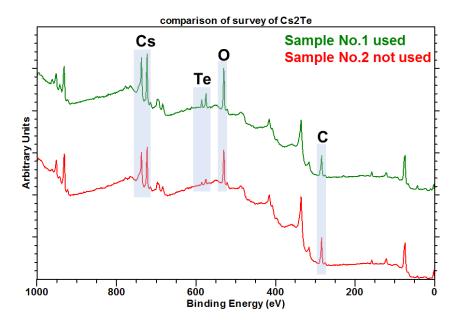

3. Cathode QE evolution during operation

	Thickness Monitor			XPS survey		
No.	Те	Cs	Cs/Te	Te peak area (%)	Cs peak area (%)	Cs/Te
1. #2021.06.07 used in gun	8.2 nm	40.3 nm	4.91	7.70 %	28.01 %	3.64
2. #2021.06.15 not used in gun	6.0 nm	32.1 nm	5.35	3.04 %	25.48 %	8.38

Courtesy: Jana Schaber

Lessons from XPS measurement:

- 1. Cs might desorb from surface when sample No. 1 was used in the gun.
- 2. In vacuum tranport is necessary:
 - All Te oxidize to Te 6+ & 4+.
 - All Cs exist as Cs 1+

4. Summary and outlook

✓ Cs₂Te on Cu is working well in HZDR SRF gun

- QE ~1%, charge life time > 10 C
- no thermal contact problem during operation
- acceptable dark current
- Dedicated RF starting up process is important to avoid MP and to preserve cathode.

Possible reasons for degradation in gun:

- Photoelectrons & unwanted beam hit cavity wall, release gases, which contaminate the cathode surface.
- Released gas molecules are ionized by photoelectrons & unwanted beam, and ions back bombard cathode.
- 3. RF heats the dielectric Cs₂Te layer.

Thank you!

Many thanks to the ELBE team and our cooperators!
