MANTRA

Measuring Anti-neutron: Tagging and Reconstruction Algorithm for frontier experiments

April 7, 2022

I. Garzia, on behalf of the MANTRA group

The MANTRA group

Name	Qualification	University/Research Institution	Months/person
I. Garzia	RTDb	UNIFE	5
S. Spataro	PA	UNITO	5
S. Marcello	PO	UNITO	1
F. De Mori	PA	UNITO	1
U. Tamponi	Ricercatore	INFN	5
A. Filippi	Primo Ric.	INFN	1

- PI: I.Garzia; Vice PI: U. Tamponi (under 40)
- Collaborations: BESIII and Belle II
- Experts on anti-neutron physics: S. Marcello and A. Filippi

The MANTRA project

We propose a method to measure the energy of anti-neutrons (n-bar's) produced in high-energy physics (HEP) experiments with an energy up to few GeV. At present, large amounts of data are being collected by several high energy physics experiments, and the possibility of studying a wealth of new reactions and still unexplored reaction mechanisms could open an effective method to reliably measure their energy and kinematics be devised, exploiting at no additional cost the current experimental set-ups. The so developed method will be released as a tool exploitable for HEP community which could be used in data analysis for several kinds of measurements in which n-bar's play a fundamental role, such as nucleon and hyperon form factors, charmed mesons decays and anti-deuteron production.

IDEA:

- fully reconstruction of n-bar's at the modern collider experiments
 - not dedicated experimental setup for n-bar reconstruction

How to:

- Electromagnetic calorimeter
 - n-bar annihilates in the EMC crystals: characteristic signature
- TOF/TOP for time measurement (also muon detectors?)

The MANTRA project: Working Packages

MANTRA

WP1 (UNITO)
Calorimeter signature:
clustering algorithm

WP2 (INFN)
Time-of-Flight
signature in Cherenkov
detector (TOP/Belle II)

WP3 (UNIFE)
Time-of-Flight
signature in scintillators
detector (TOF/BESIII)

WP4 (INFN)
Development of a
global reconstruction
algorithm

WP5 (UNIFE)
Dissemination

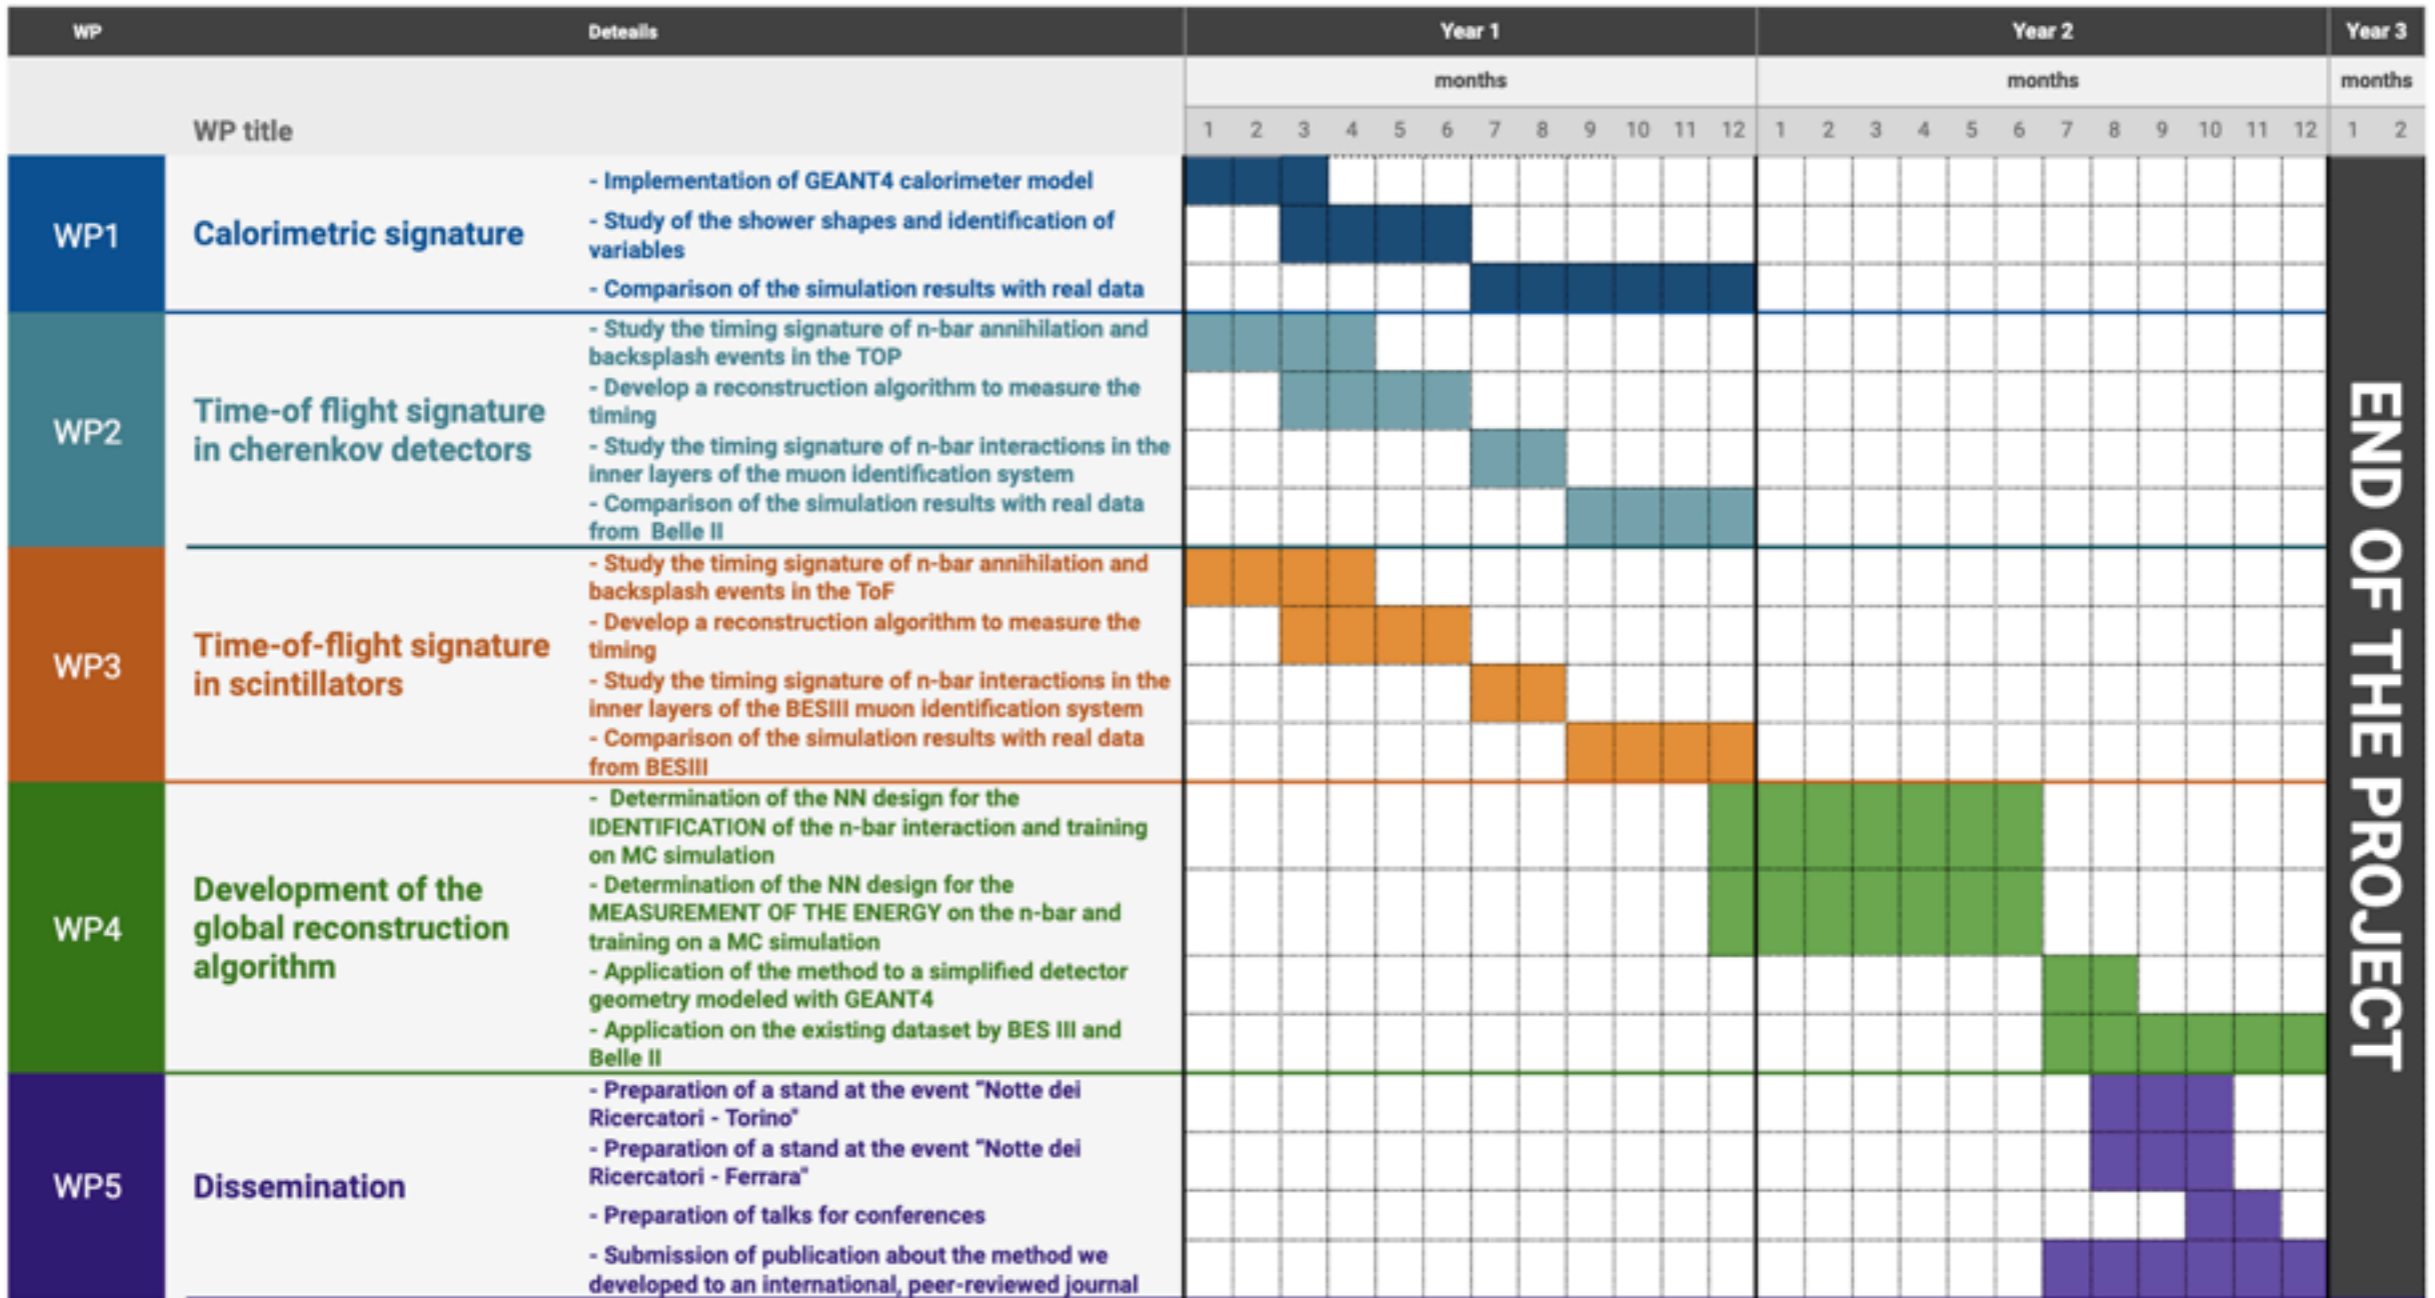

BESIII and Belle II data

GANTT - MANTRA

Project Title **MANTRA - Measuring Anti-Neutron: Tagging and Reconstruction Algorithm for frontier experiments** DATA 30/03/2022

END OF THE PROJECT

Project impact

MANTRA is a fundamental research project. By its nature it is not expected to produce an immediate economic or industrial impact

- 3 Research grants, each of 18 months
 - form highly-trained, young researches and professionals
 - WP4: study of NN-based algorithms
 - impact also in industry and business
- The developed tool could be used for n -bar identification and energy reconstruction in all particle detector in which an electromagnetic calorimeter and detectors for the measurement of the time-of-flight are available
- Large data set still available (BESIII, Belle II): no additional cost and investment in new experiments are required
- Open the door to a large number of measurements in which n -bar's play a fundamental role (nucleon and hyperon form factors, charmed mesons decays, anti-deuteron production, ...)

Conclusions

**Thanks to all the people involved in the
MANTRA project**
