Outline

- Introduction to SiPM
- Types of correlated noise in SiPM
- Correlated noise as a function of V_{ov} and temperature

About Silicon-Photomultiplier

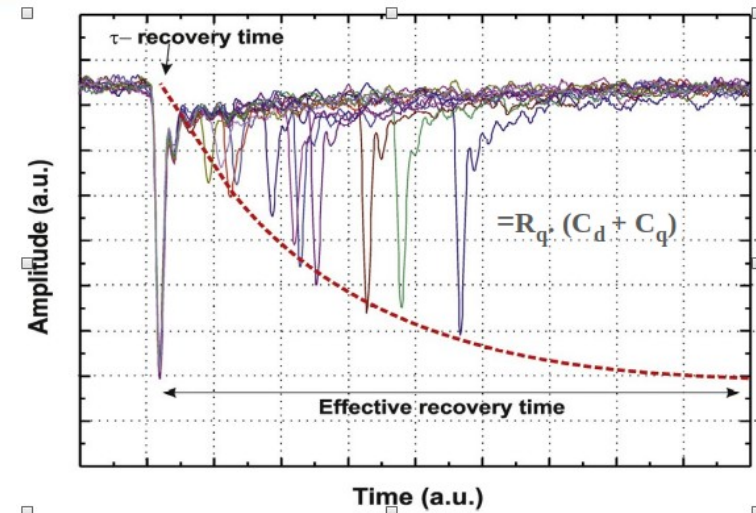

SiPM:

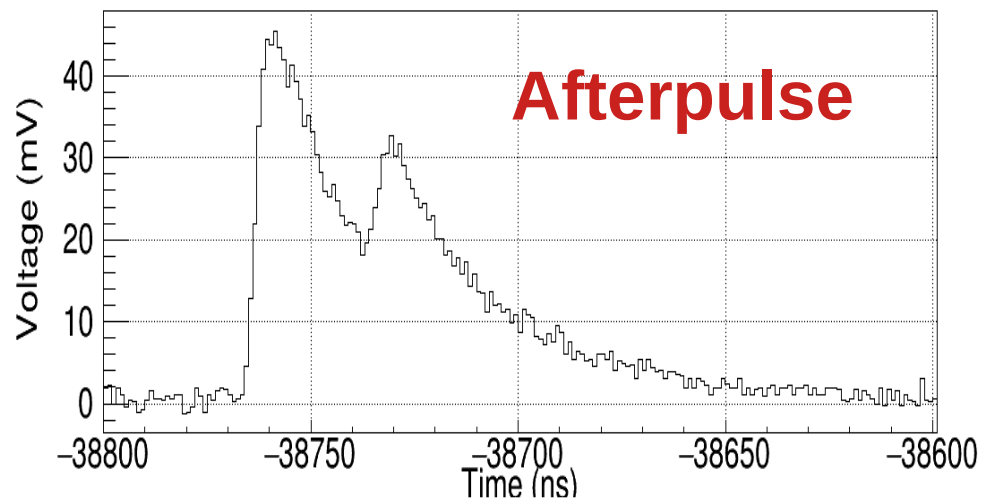

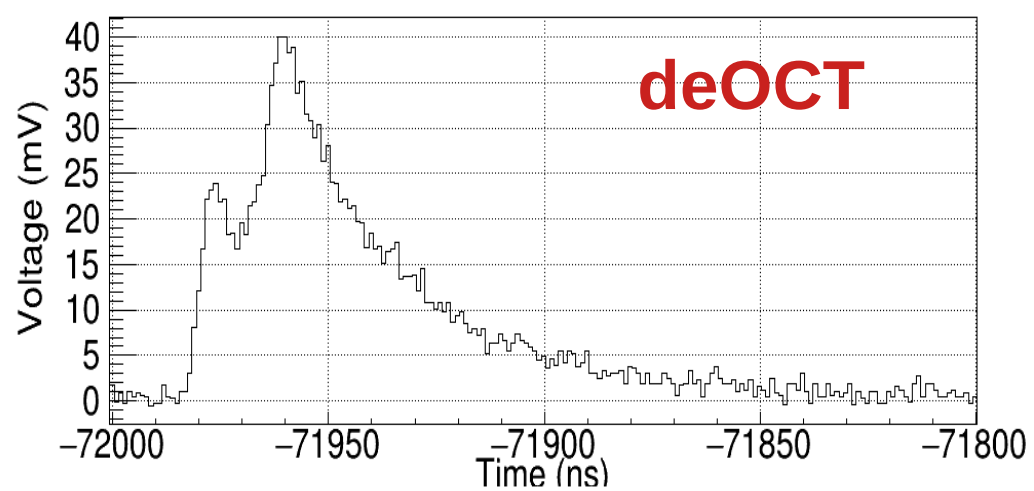

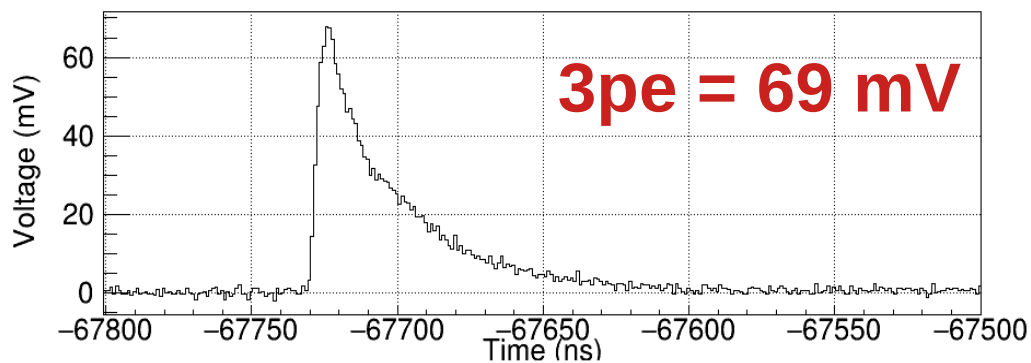

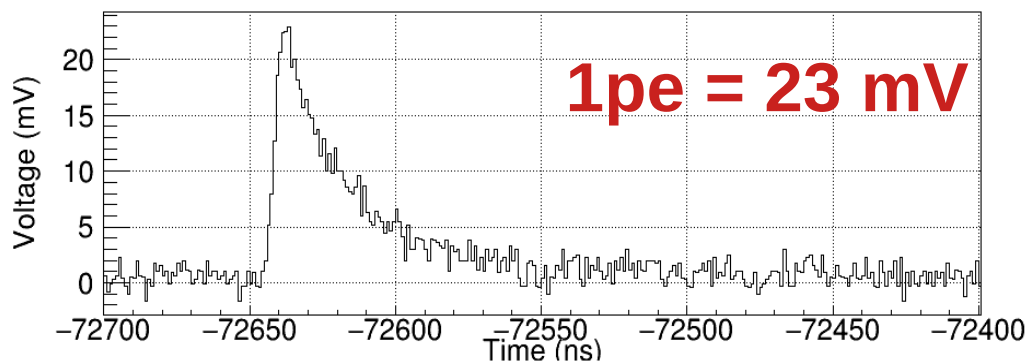

- matrix of n pixels (~ 1000) in parallel
- each pixel: GM-APD + $R_{\text{quenching}}$

- S13360-2050VE Hammamatsu
- 2mm x 2mm with 1584 pixels, microcell of 50 μm pitch, fill factor of 74%
- Overvoltage (V_{ov}) = $V_{\text{bias}} - V_{\text{bd}}$, V_{bd} : $(53 \pm 5)\text{V}$
- Spectral range : 320 - 900 nm

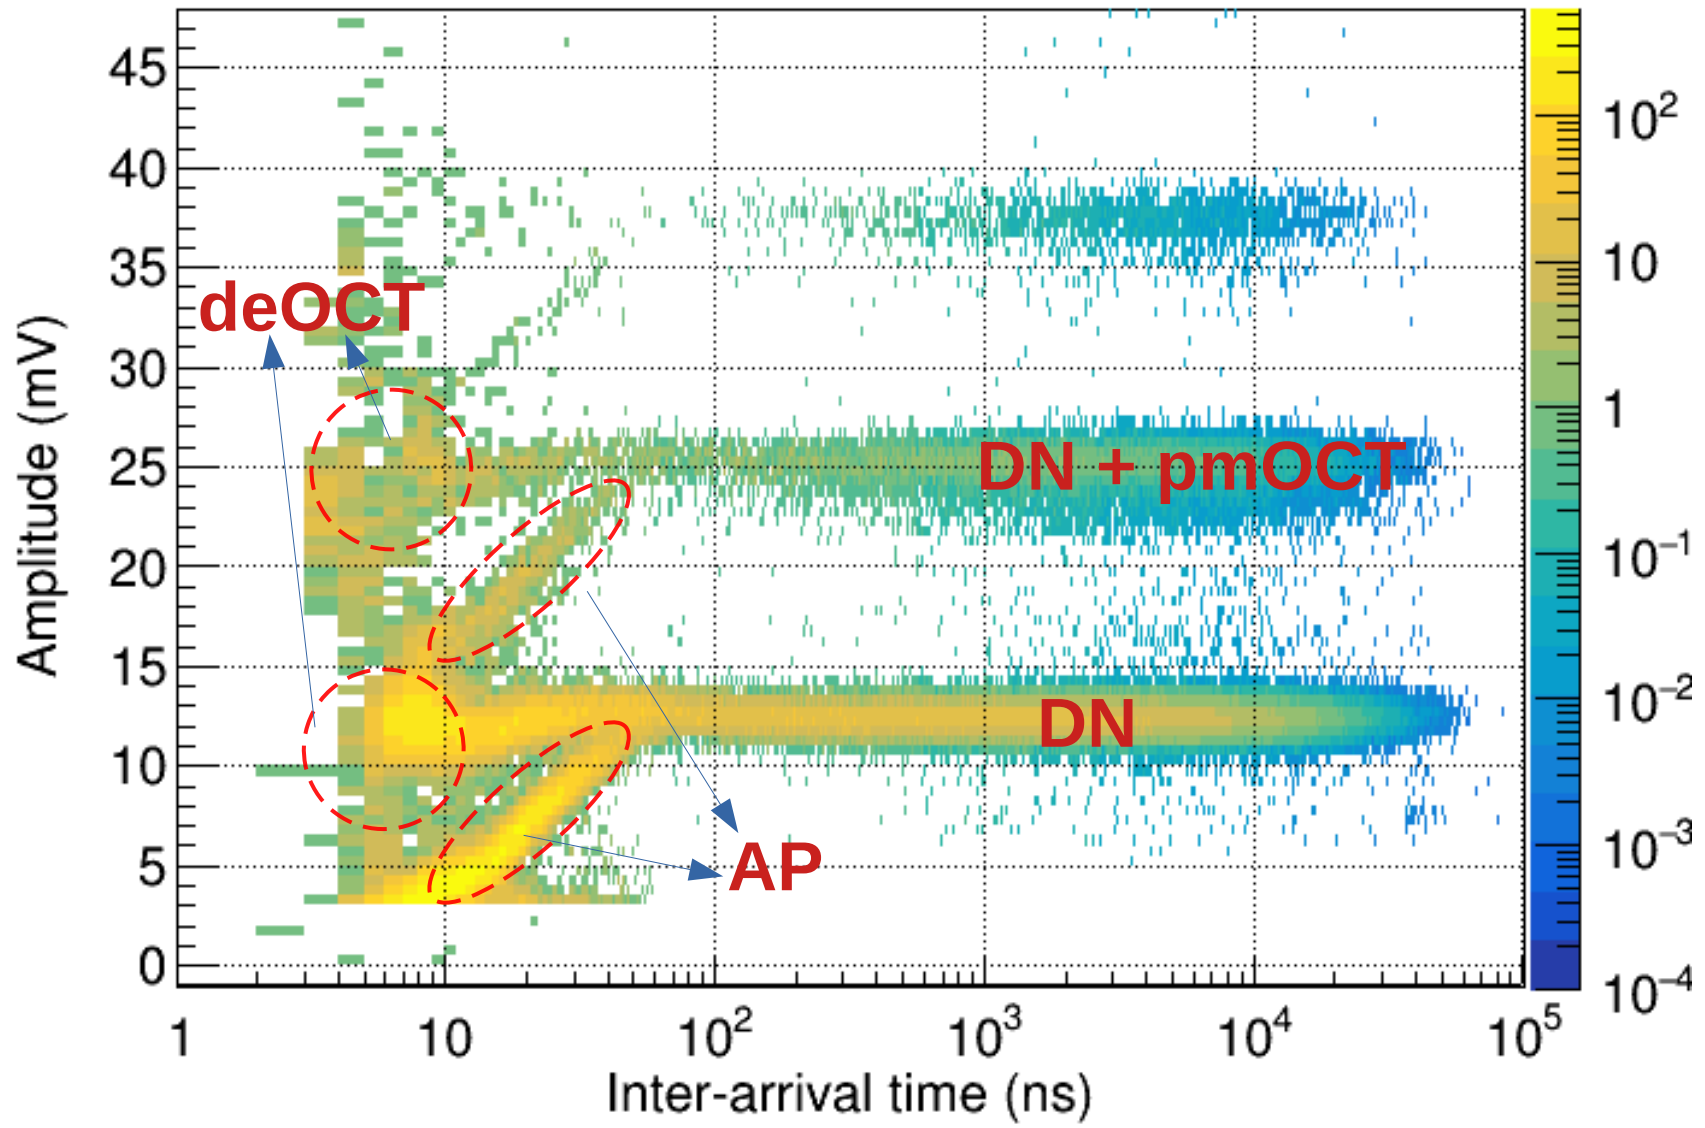

Correlated noise in SiPM

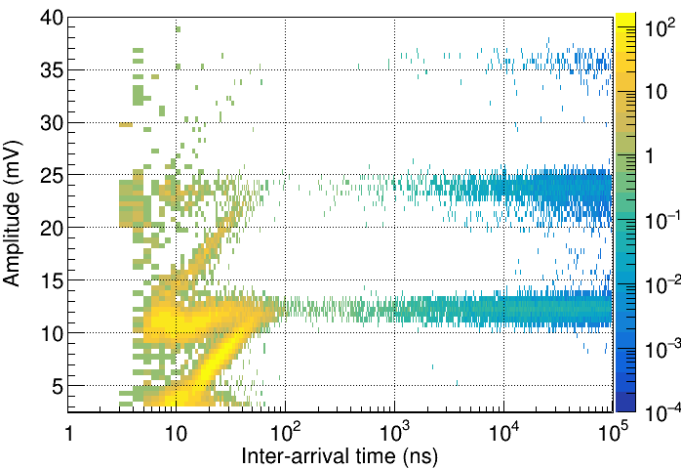

Correlated noise in SiPM

Correlated noise in SiPM

Correlated noise in SiPM

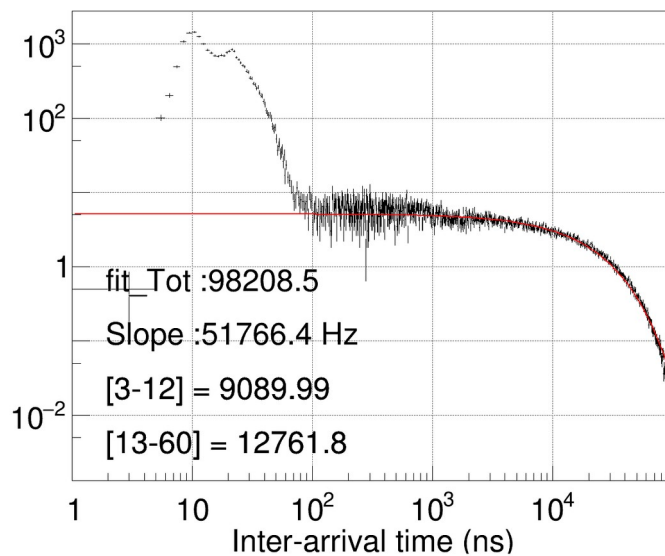

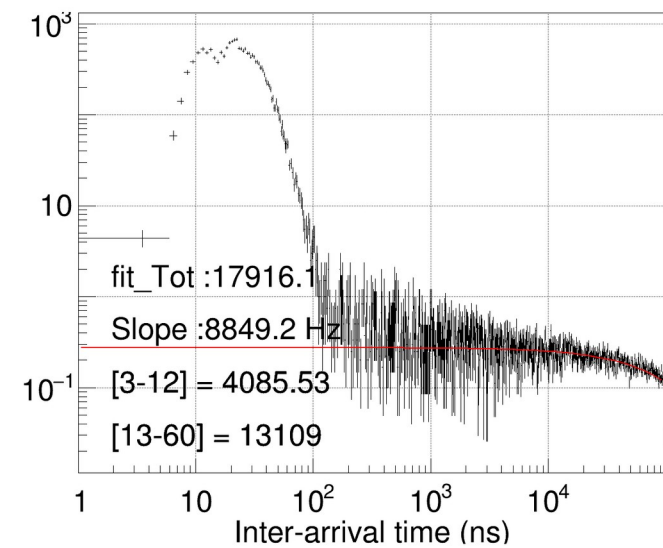

$-20\text{ }^{\circ}\text{C}$

$10\text{ }^{\circ}\text{C}$

$40\text{ }^{\circ}\text{C}$

Dark noise w.r.t. V_{ov} and temperature

Dark noise measurement from the slope of exponential fit

Delayed Optical Crosstalk

The absolute rate of delayed optical crosstalk increases with increasing temperature and overvoltage.
The fraction of deOCT out of total noise is decreasing with increasing temperature.

Afterpulsing

The absolute rate of afterpulse increases with increasing temperature and overvoltage.

The fraction of afterpulse out of total noise is decreasing with increasing temperature.

pmOCT

Same observations for prompt optical crosstalk!!

THANK YOU!!
