ArDM operations on its cryogenic setup

ArDM setup

What you have just seen

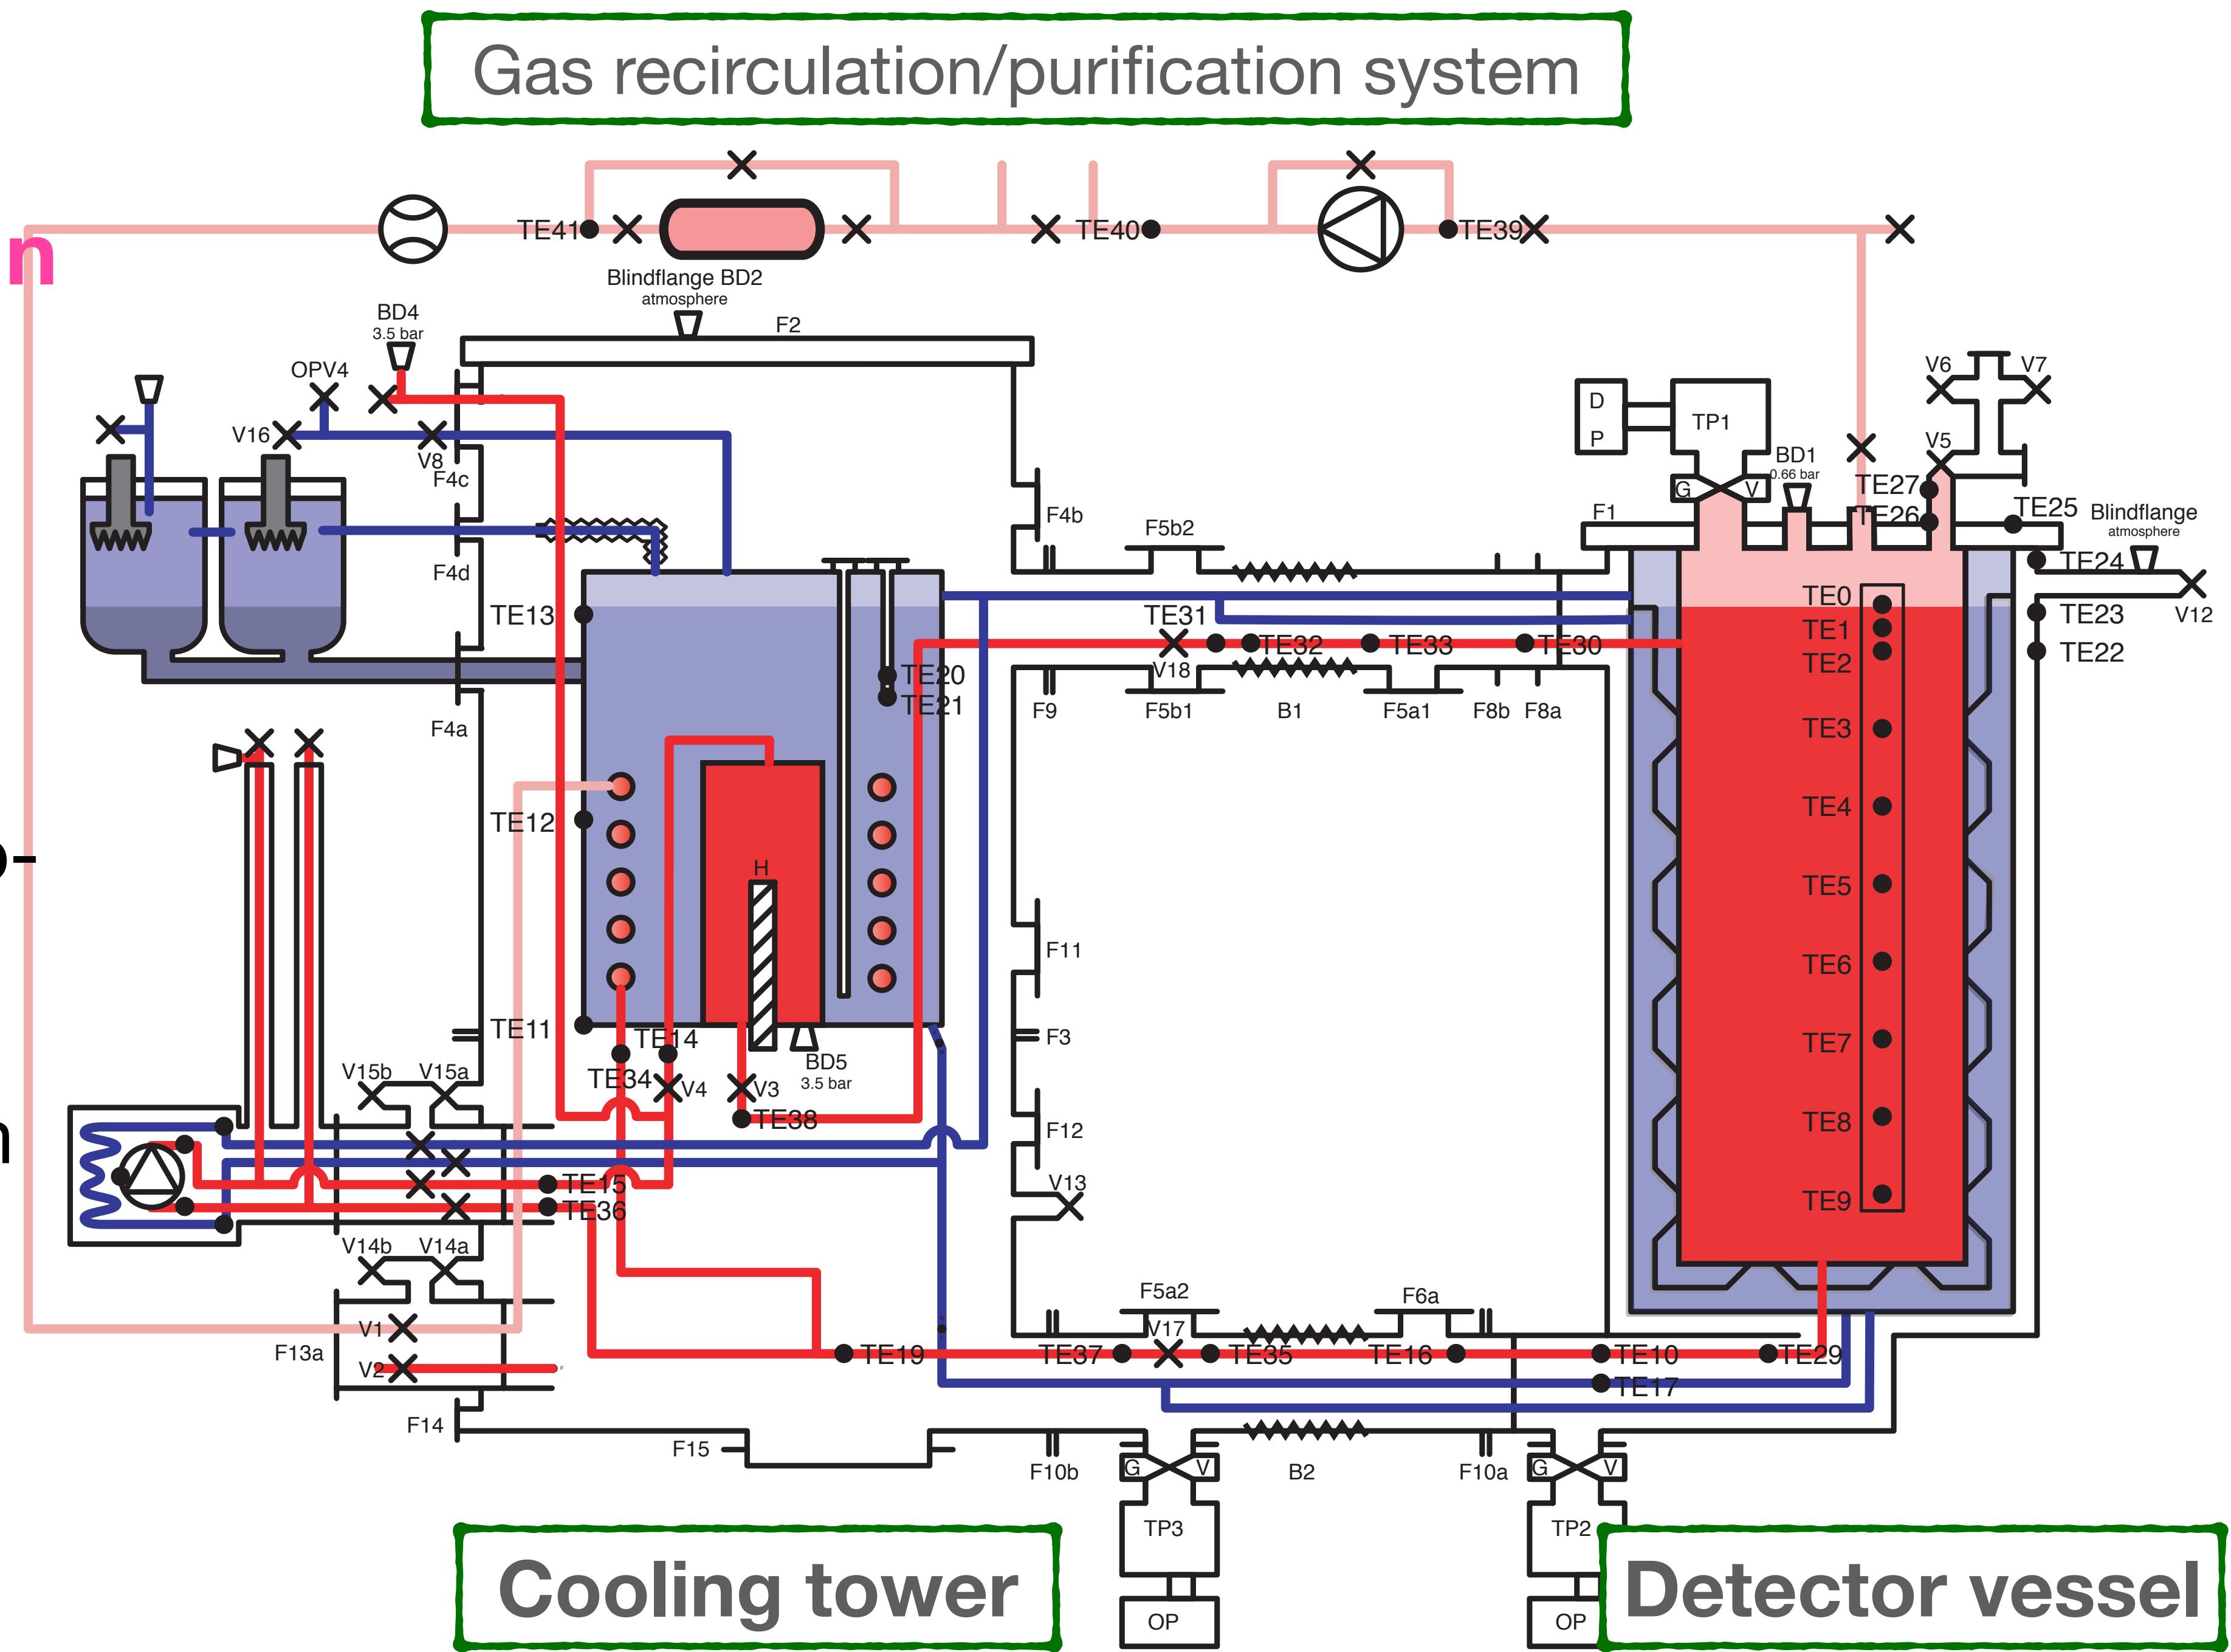

- The last run completed in 2019
- ~tonne LAr transferred to the “recovery vessel”
- The setup in hibernation since
- Pure LAr kept in the recovery vessel, using a cryocooler

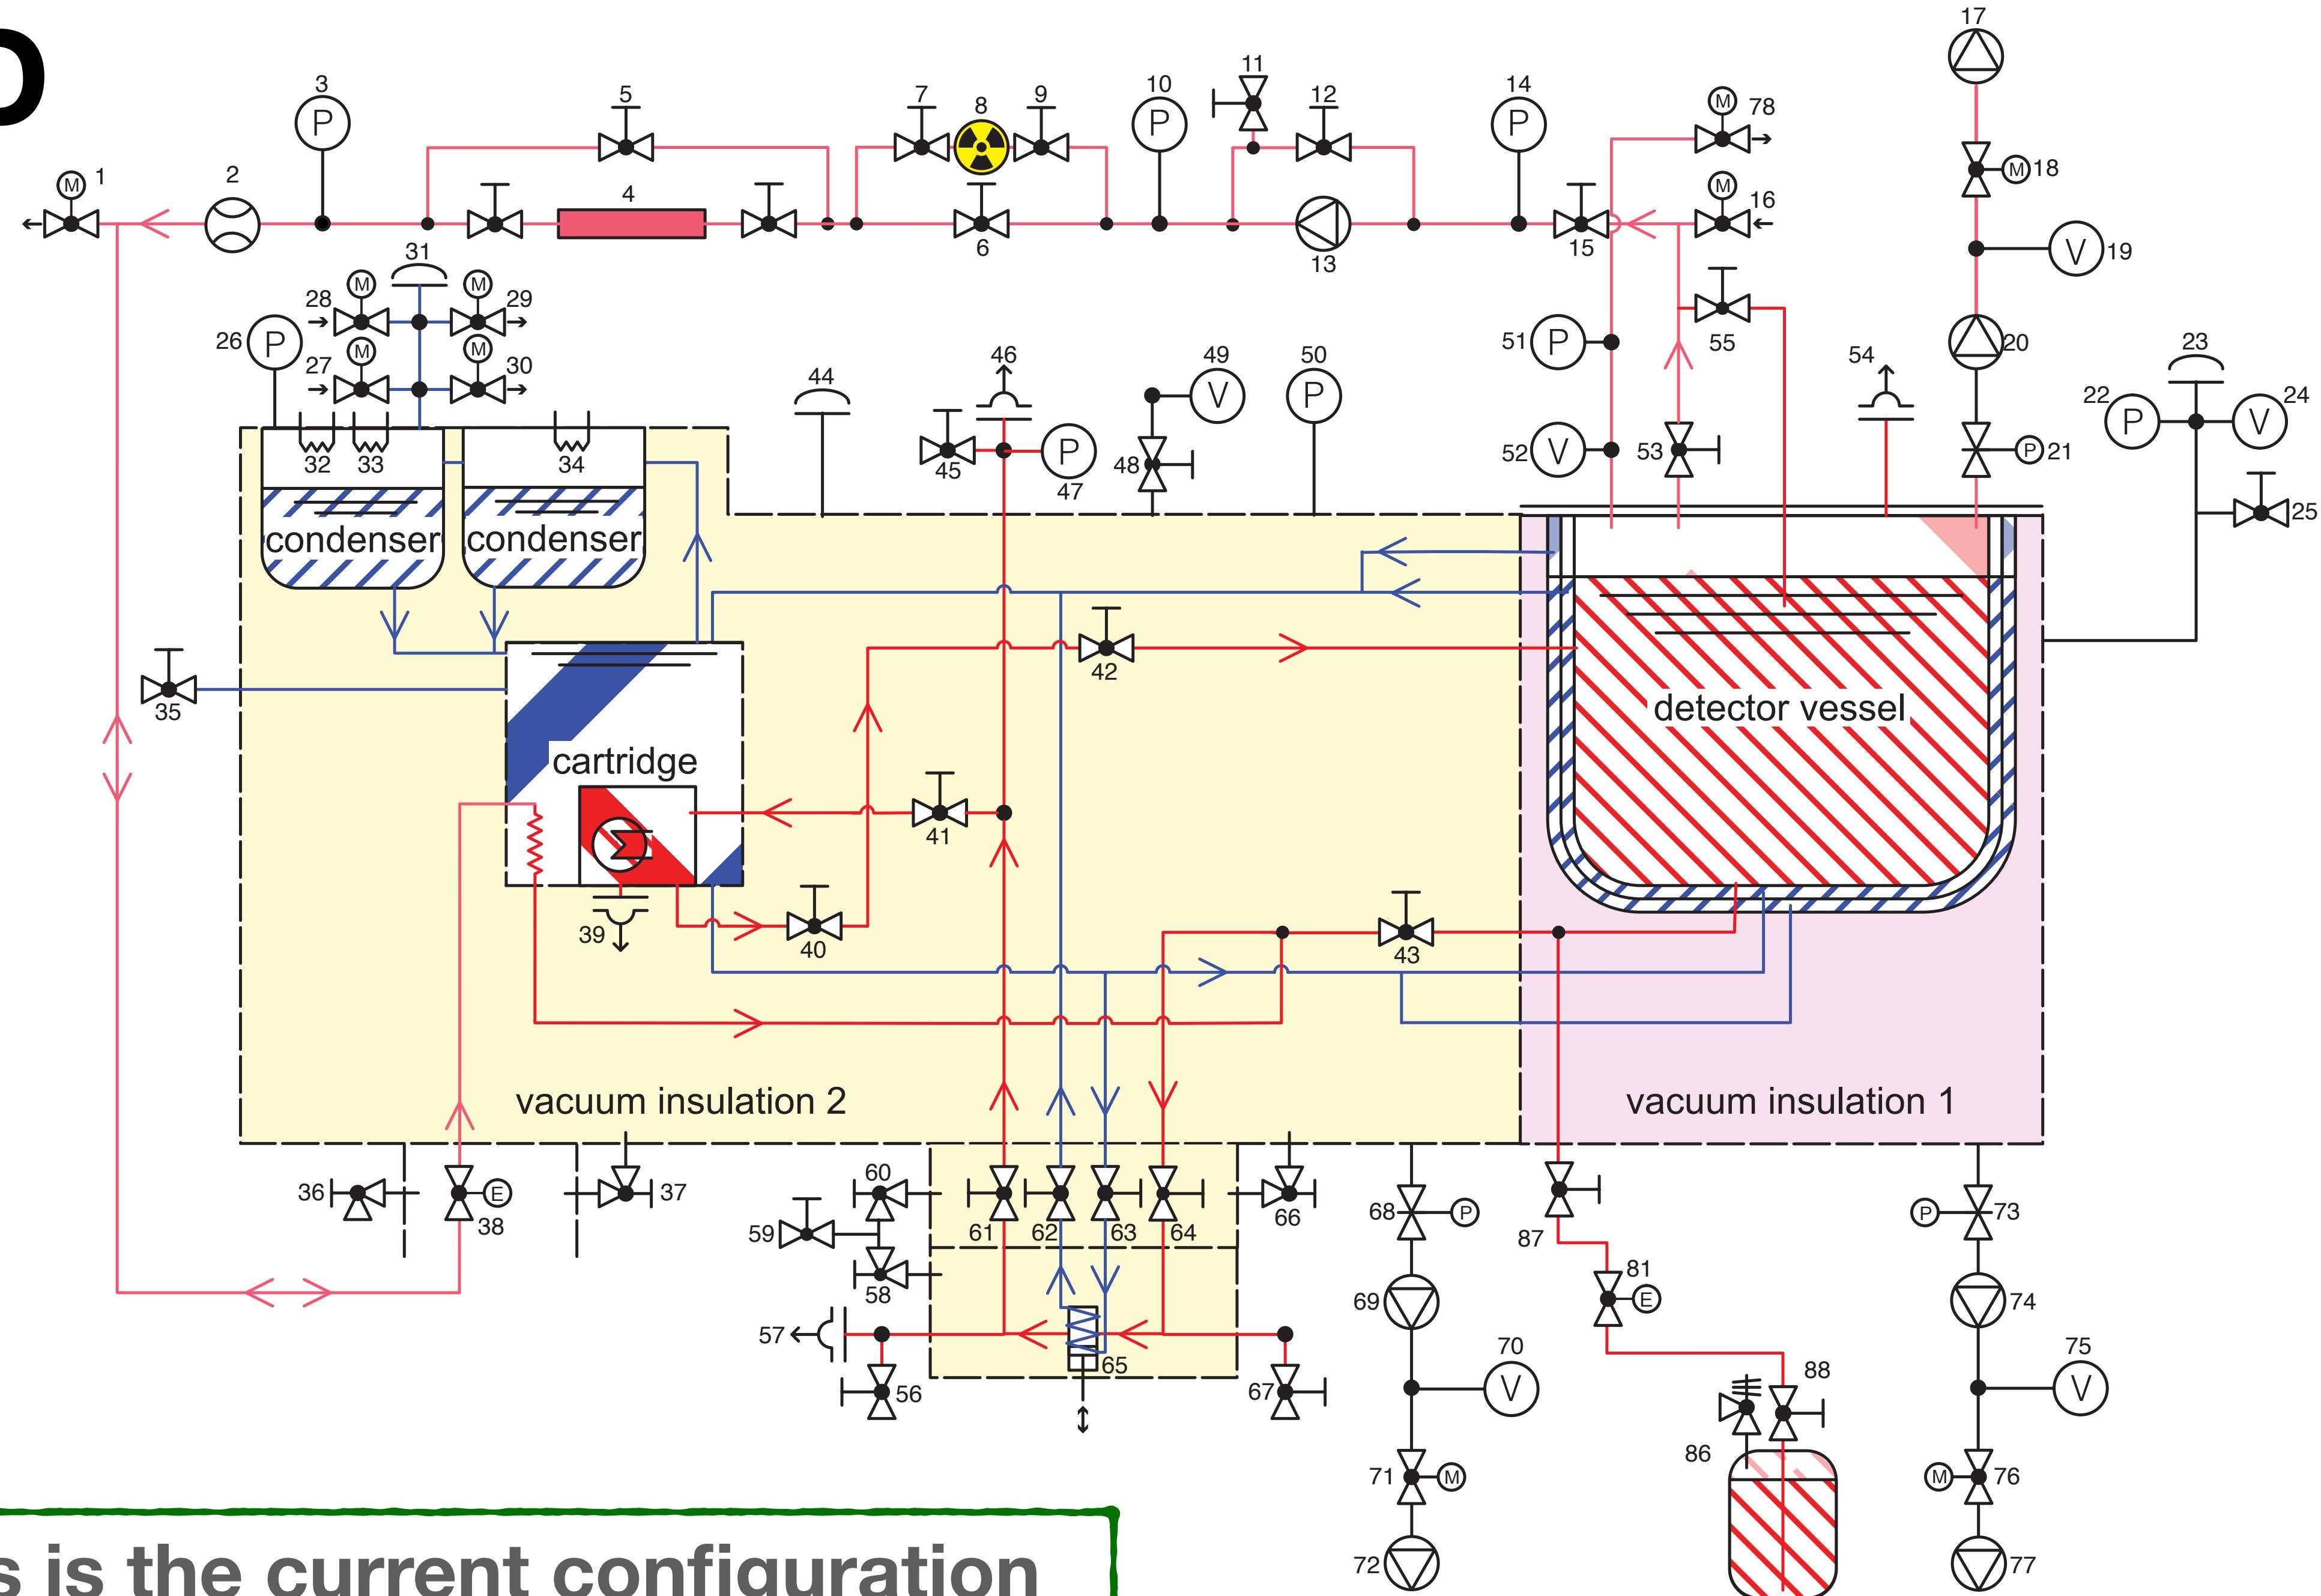

Concept

Cooling bath design

- Two LAr circuits
 - Pure Ar
 - Cooling bath
 - The bath argon is cooled by the cryo-coolers
 - The pure argon is cooled by the bath argon
- $P_{\text{Bath}} < P_{\text{Pure}} \lesssim P_{\text{DArT}}$
- $T_{\text{Bath}} < T_{\text{Pure}} \lesssim T_{\text{DArT}}$
- $P_{\text{Pure}} \sim 1000 \text{ mbar}$

P&ID

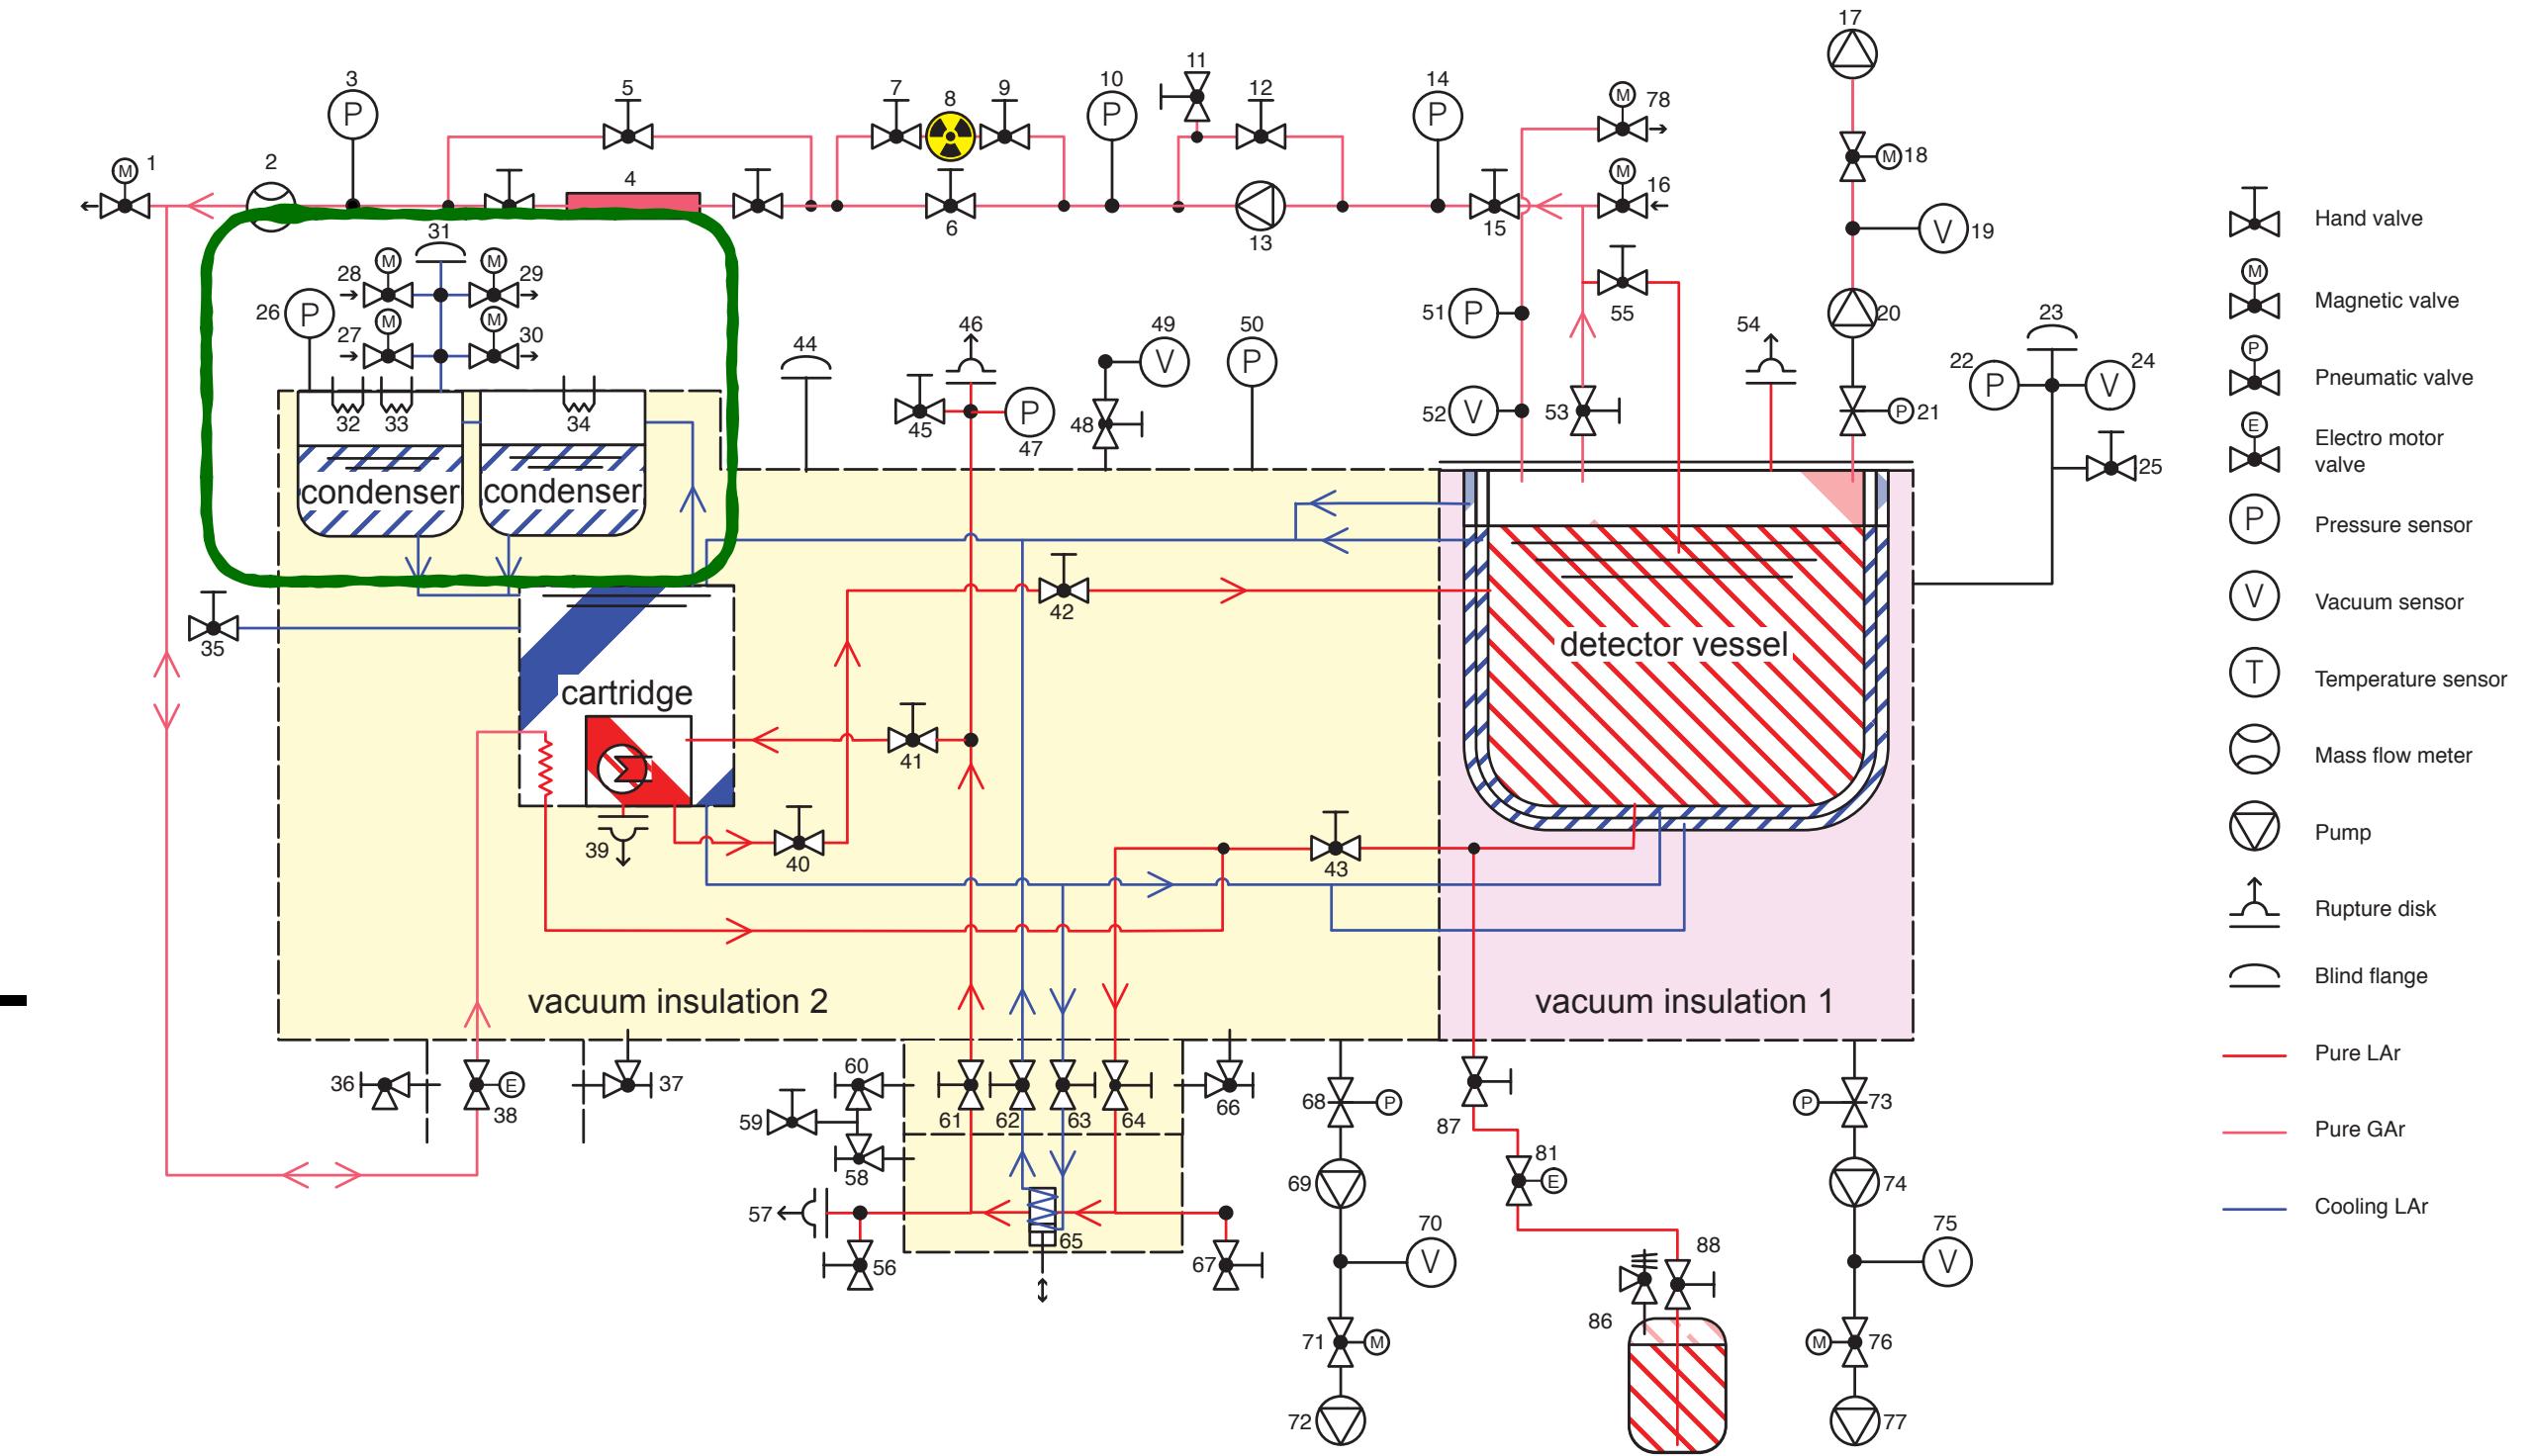

This is the current configuration

Cooling system

Cryocoolers

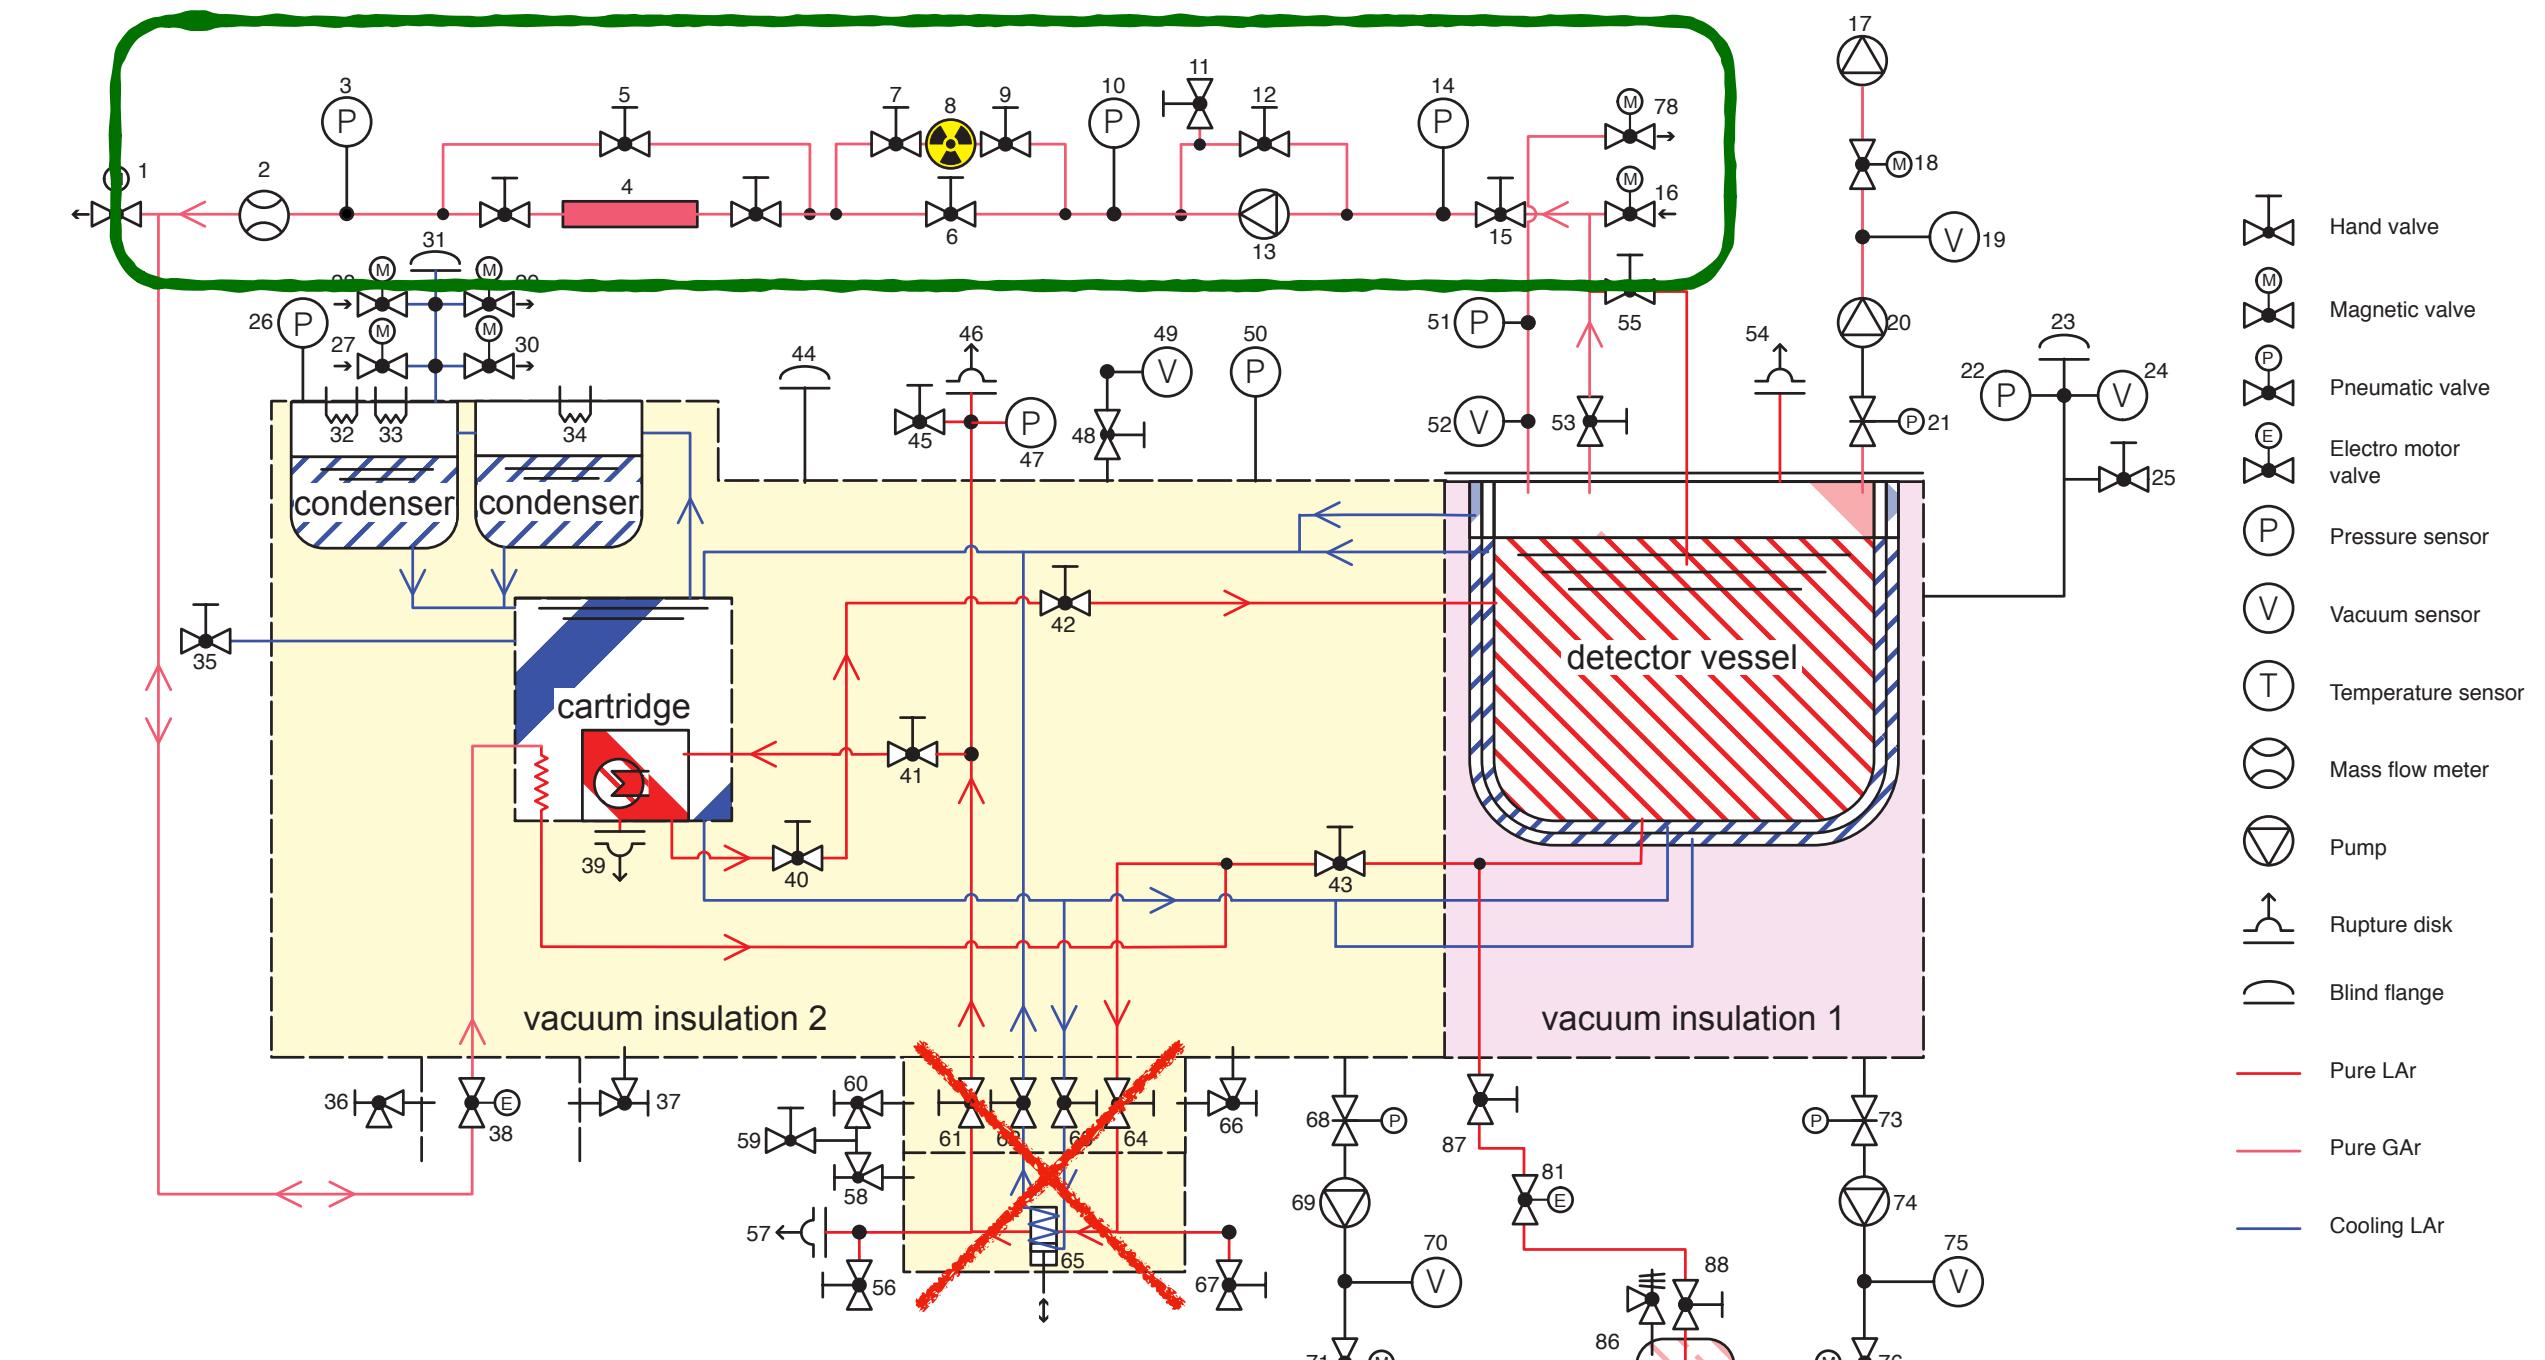

- Three cryocoolers : CC1, CC2 and CC3
 - 2 CCs needed to maintain the thermodynamic conditions
 - 3rd used for filling (condensing)
 - Condenser 1 with CC1 and CC2
 - Condenser 2 with CC3
 - The system pressure/temperature is PID regulated by resistive heaters compensating the cooling power

Ar purification system

Gas recirculation with a getter

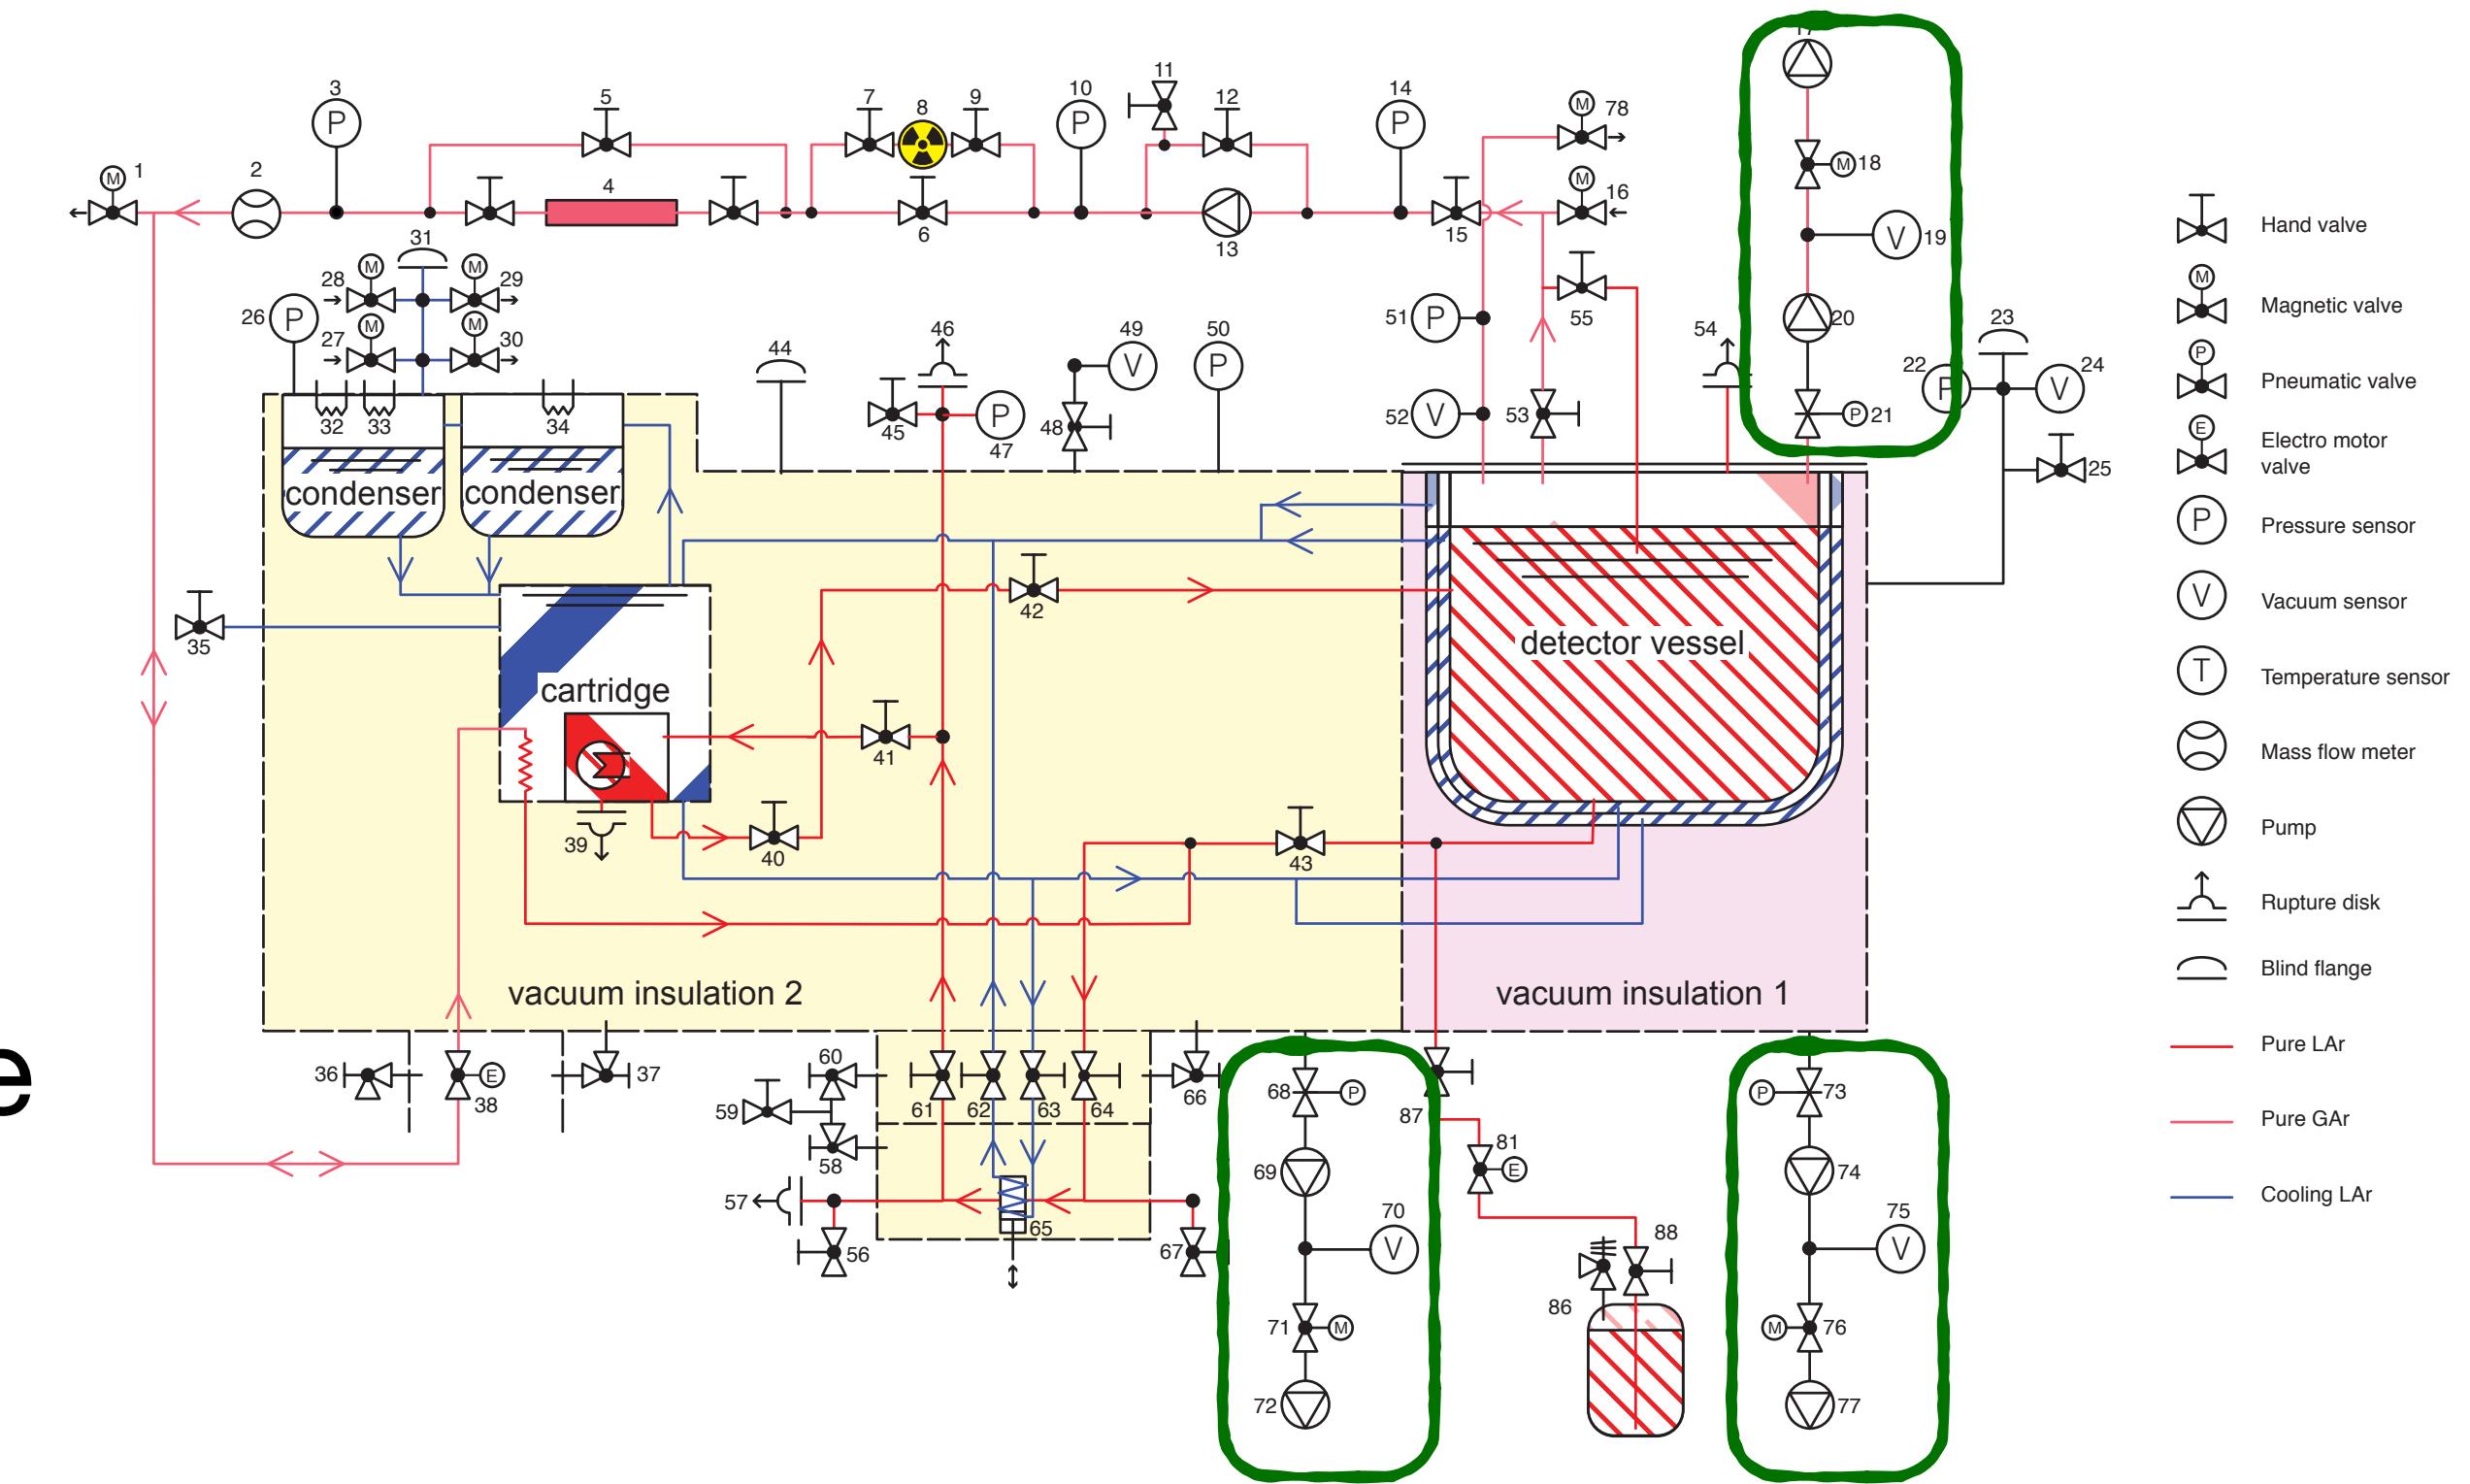

- Components
 - Snorkel
 - Gas recirculation pump – adjustable pumping speed
 - Heating bands
 - Hot getter
 - Liquid recirculation pump out of service

Vacuum system

Three sets of pumping systems

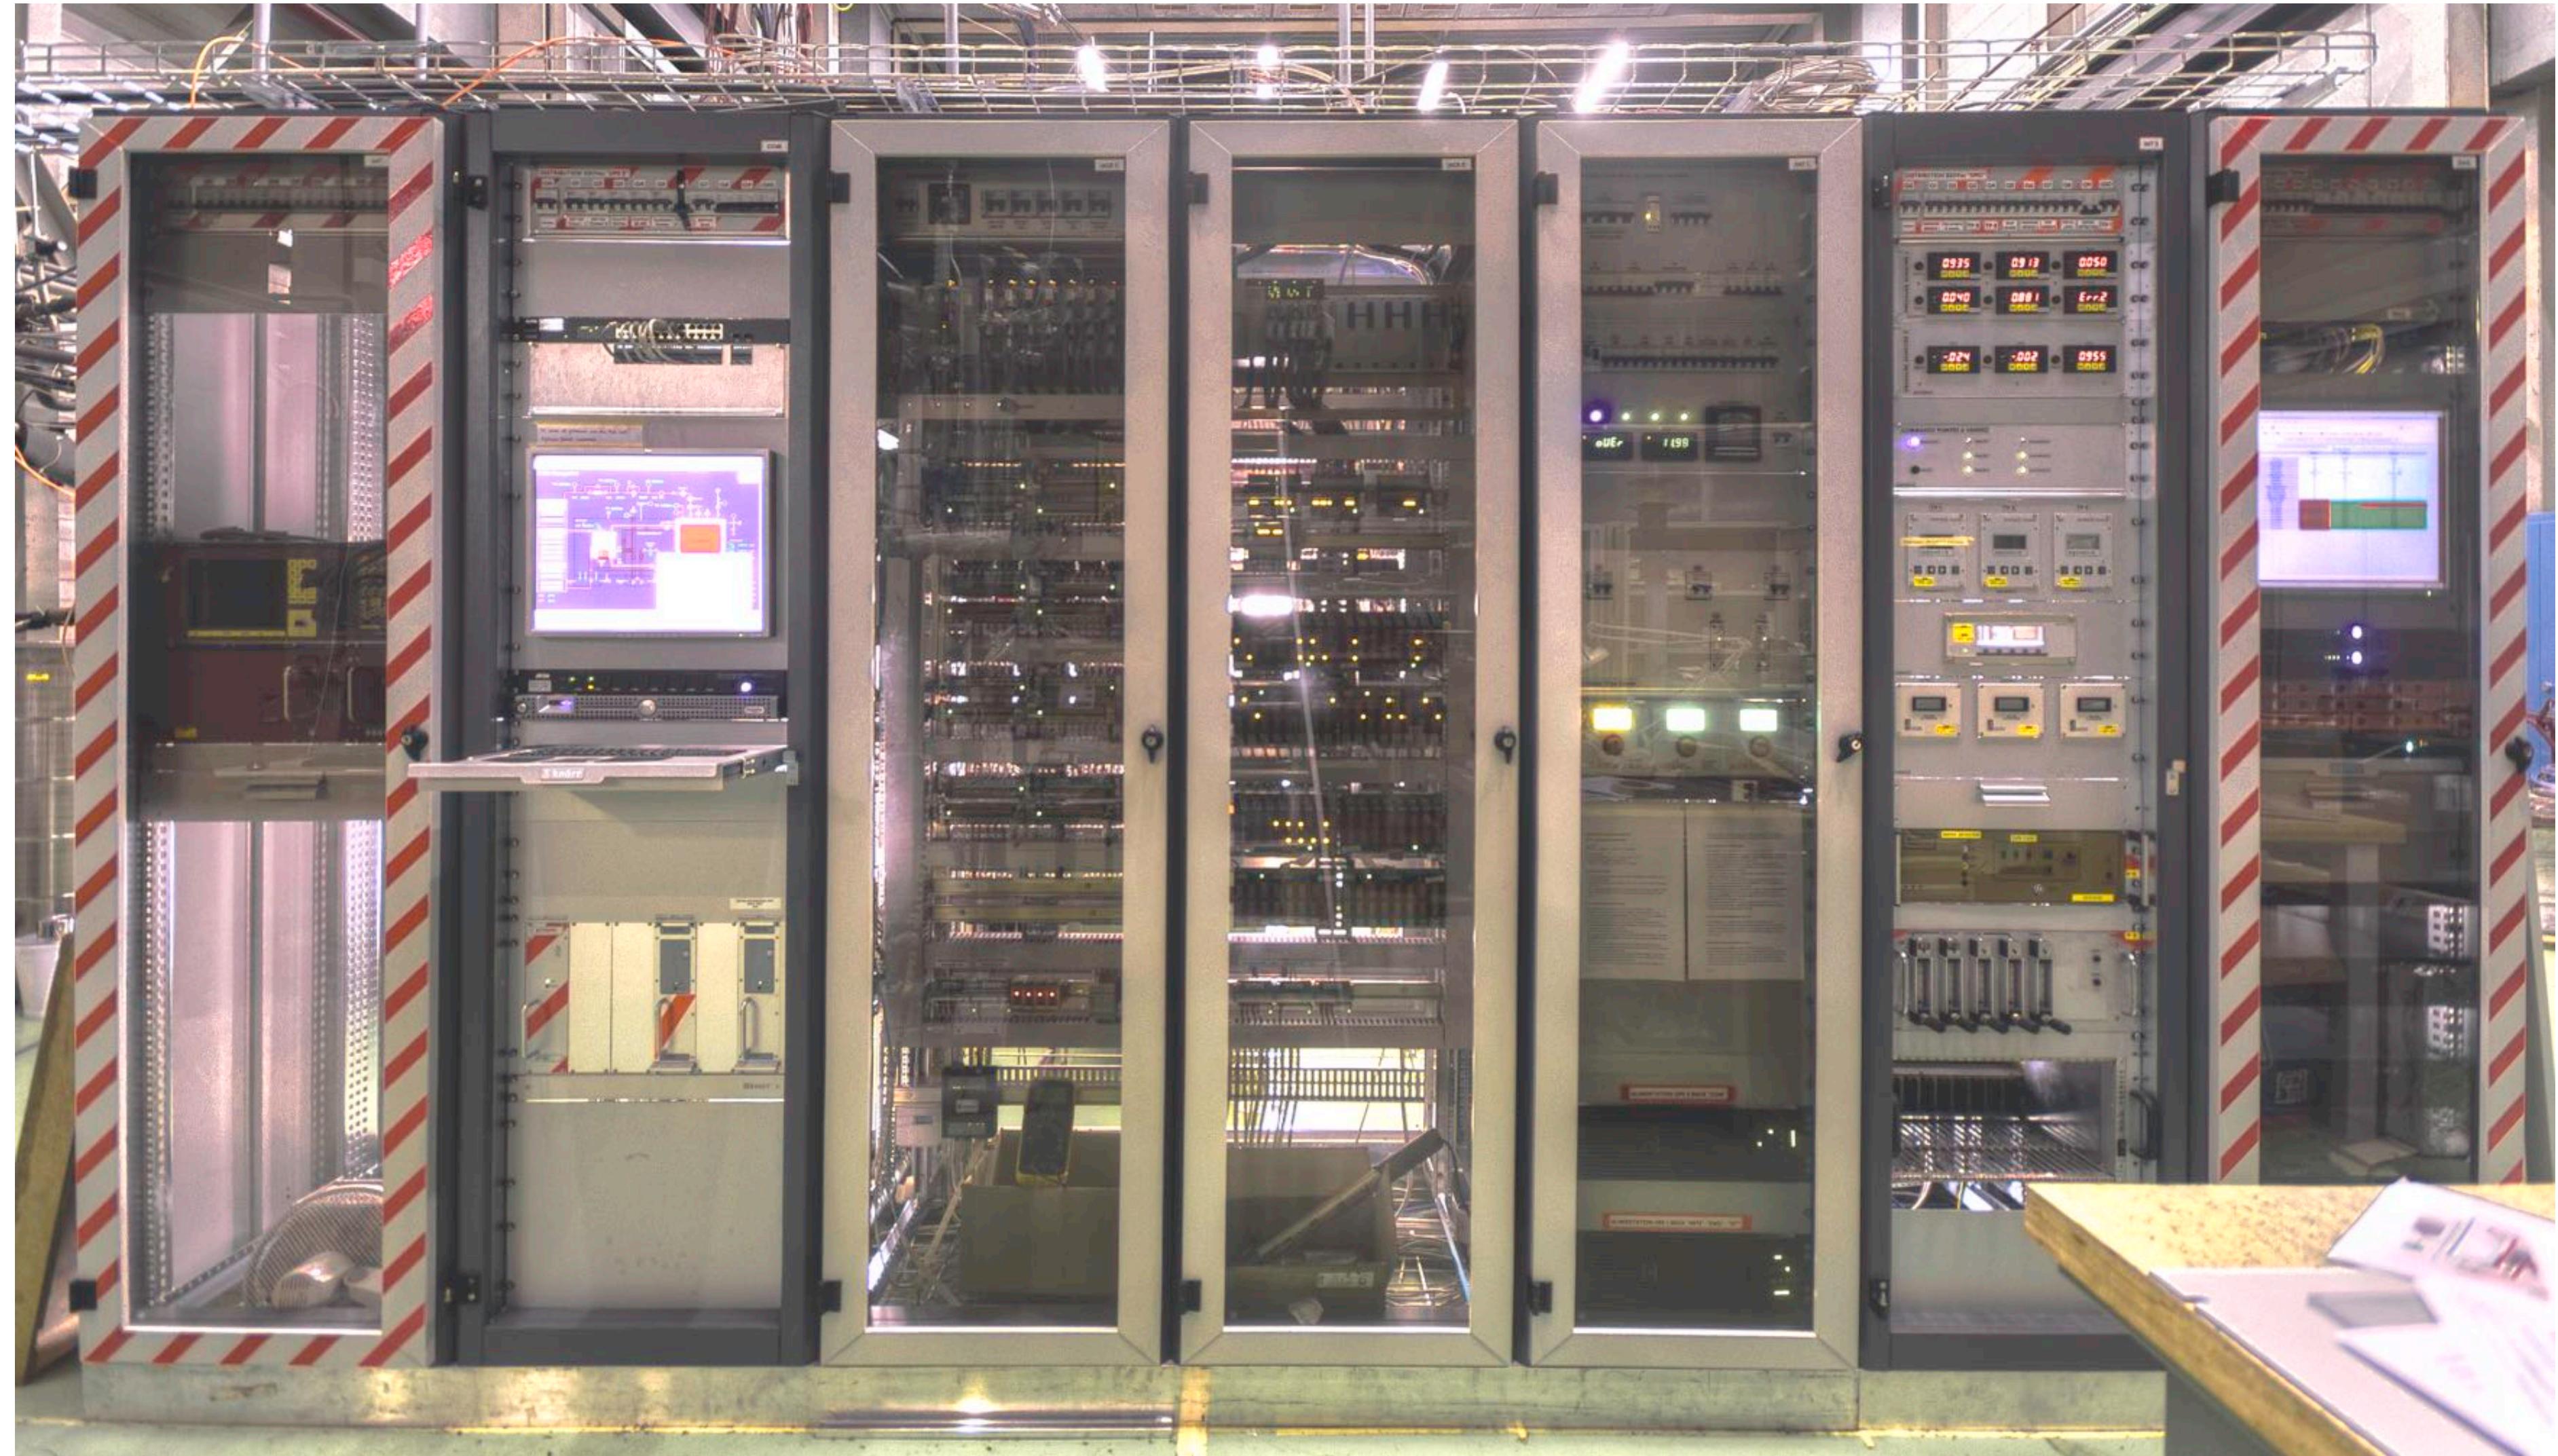

- InsVac1, InsVac2 and the pure Ar volume
- Gate valve + Turbo + Rotary pump
- Each volume has a pressure and a vacuum gauge
- InsVac1 and InsVac2 are to be kept pumped continuously

Slow control

PLC-based control system + UNICOS PVSS SCADA system

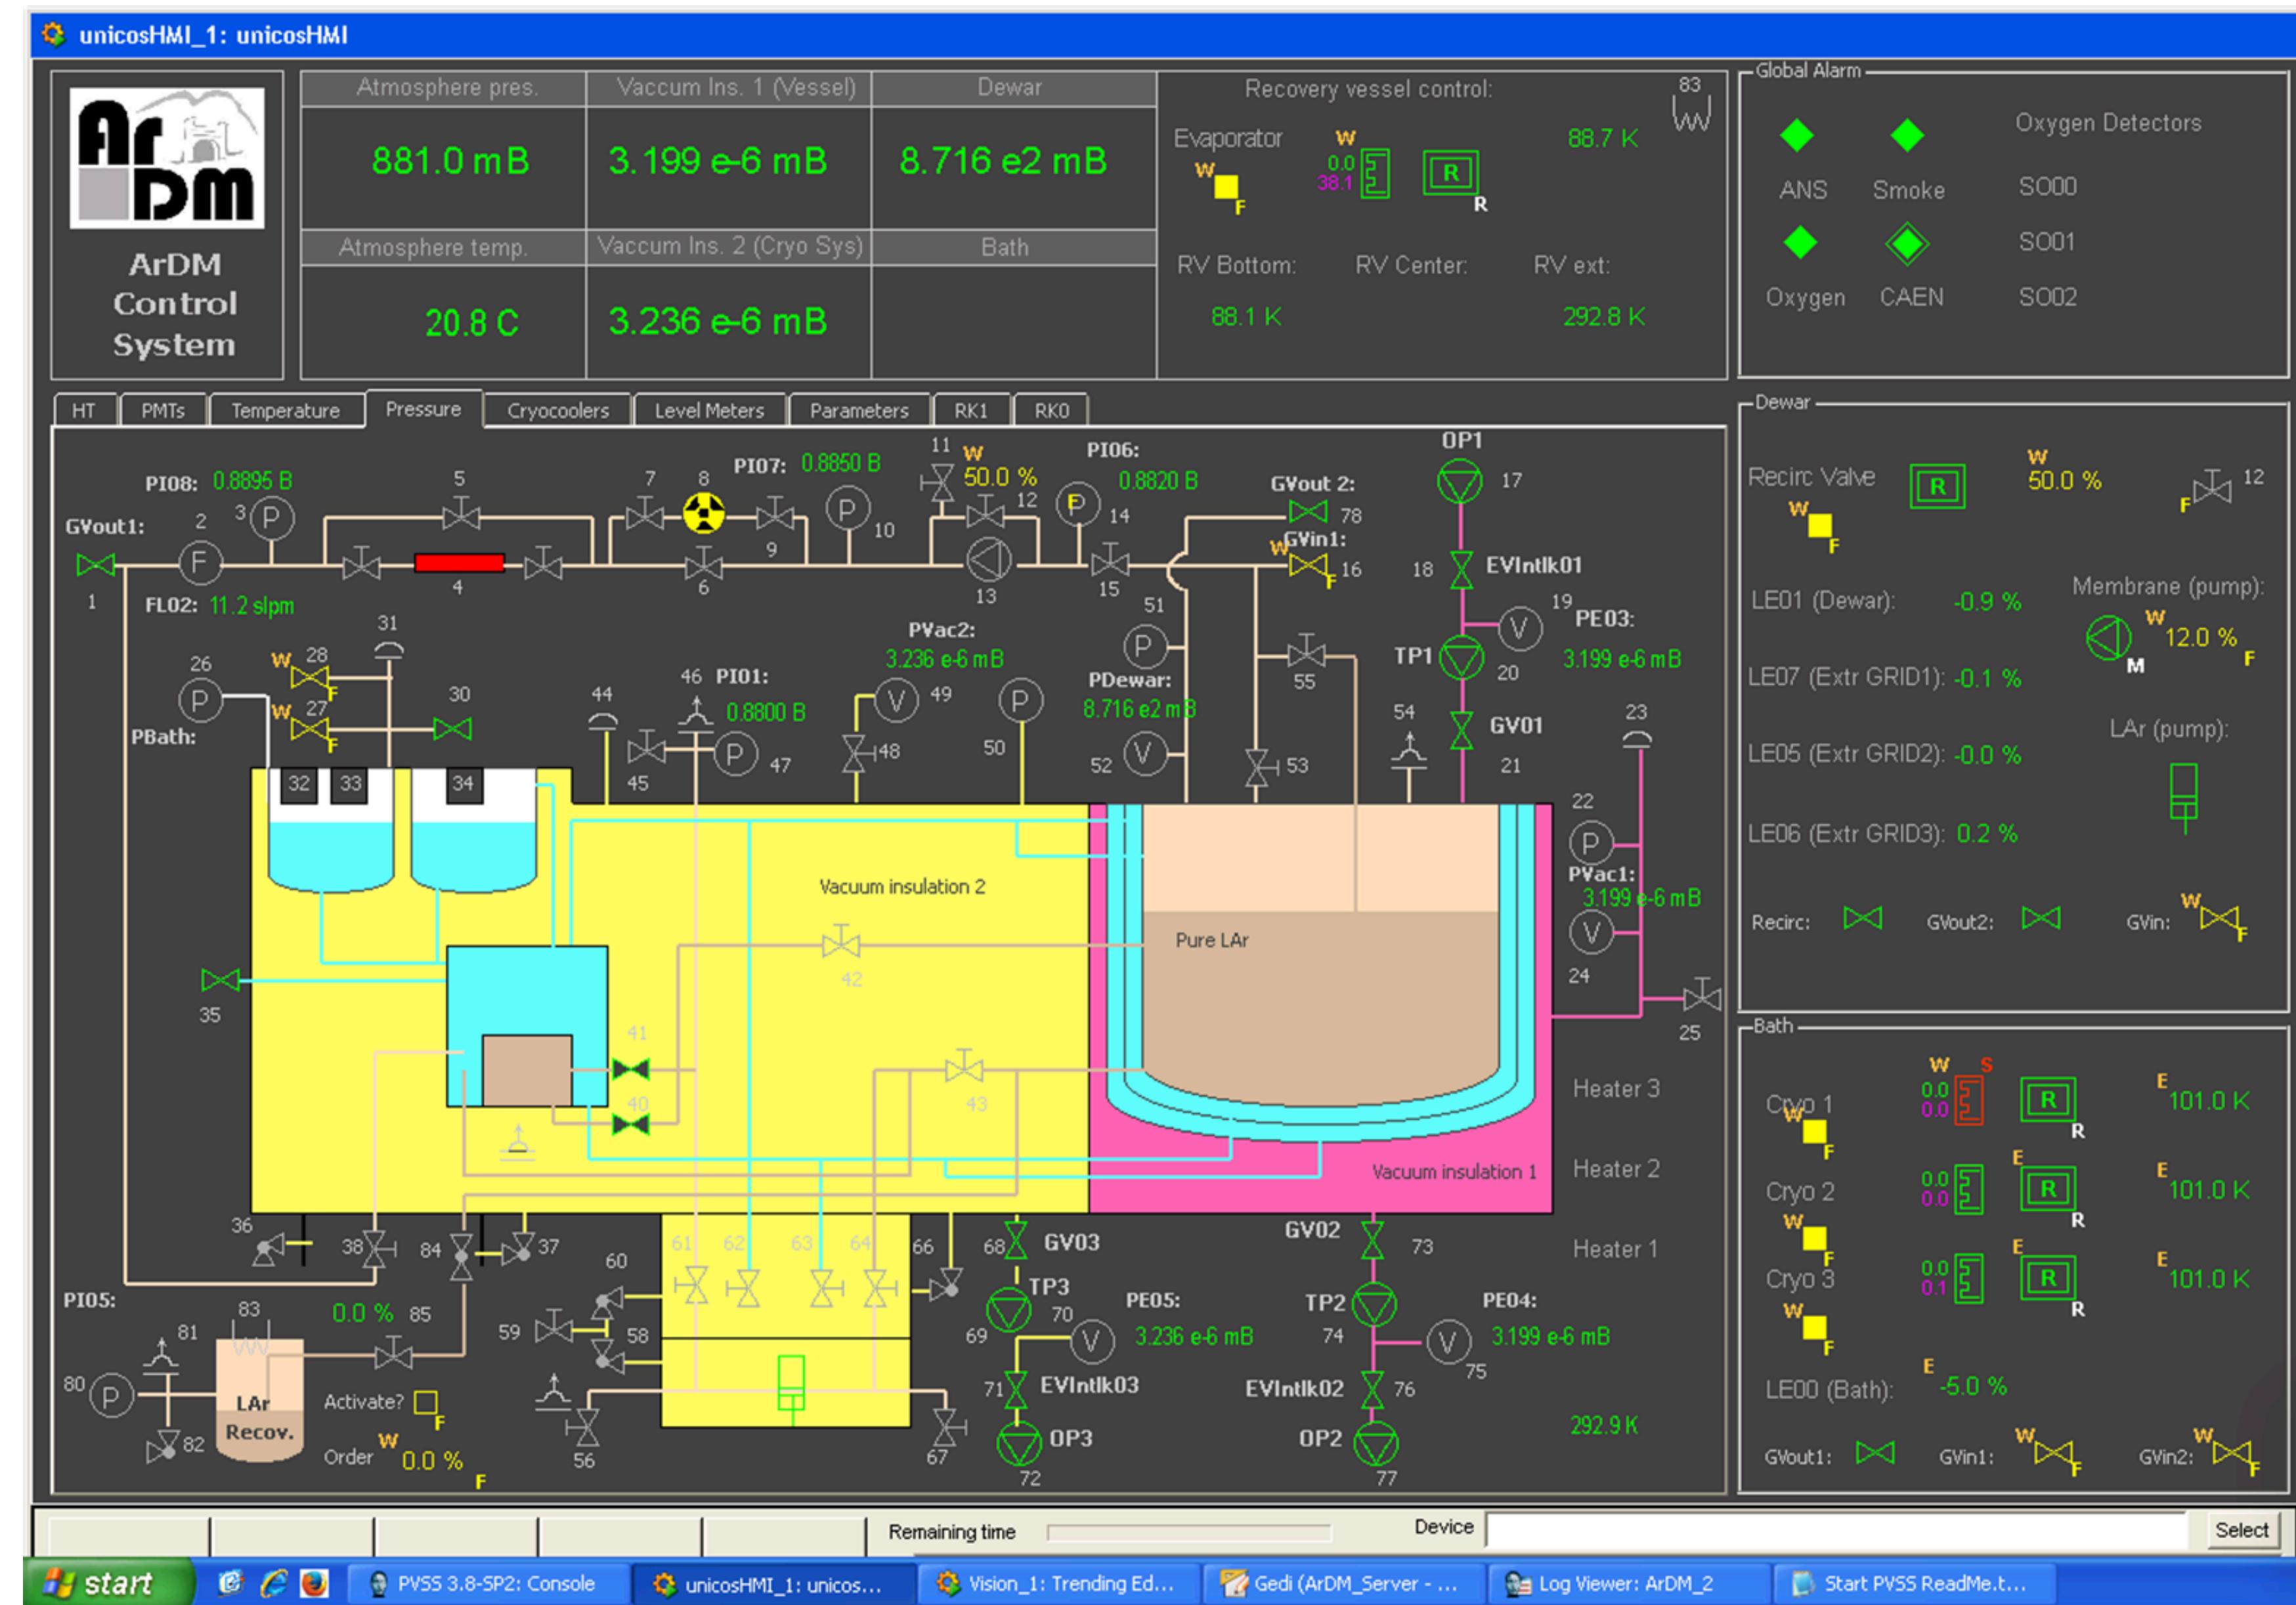

- Made in CERN
- The entire ArDM setup operates fully automatically
- The “industrial” PLC system is robust and reliable
- Update not foreseen
- The devices have to be maintained

Slow control

PVSS

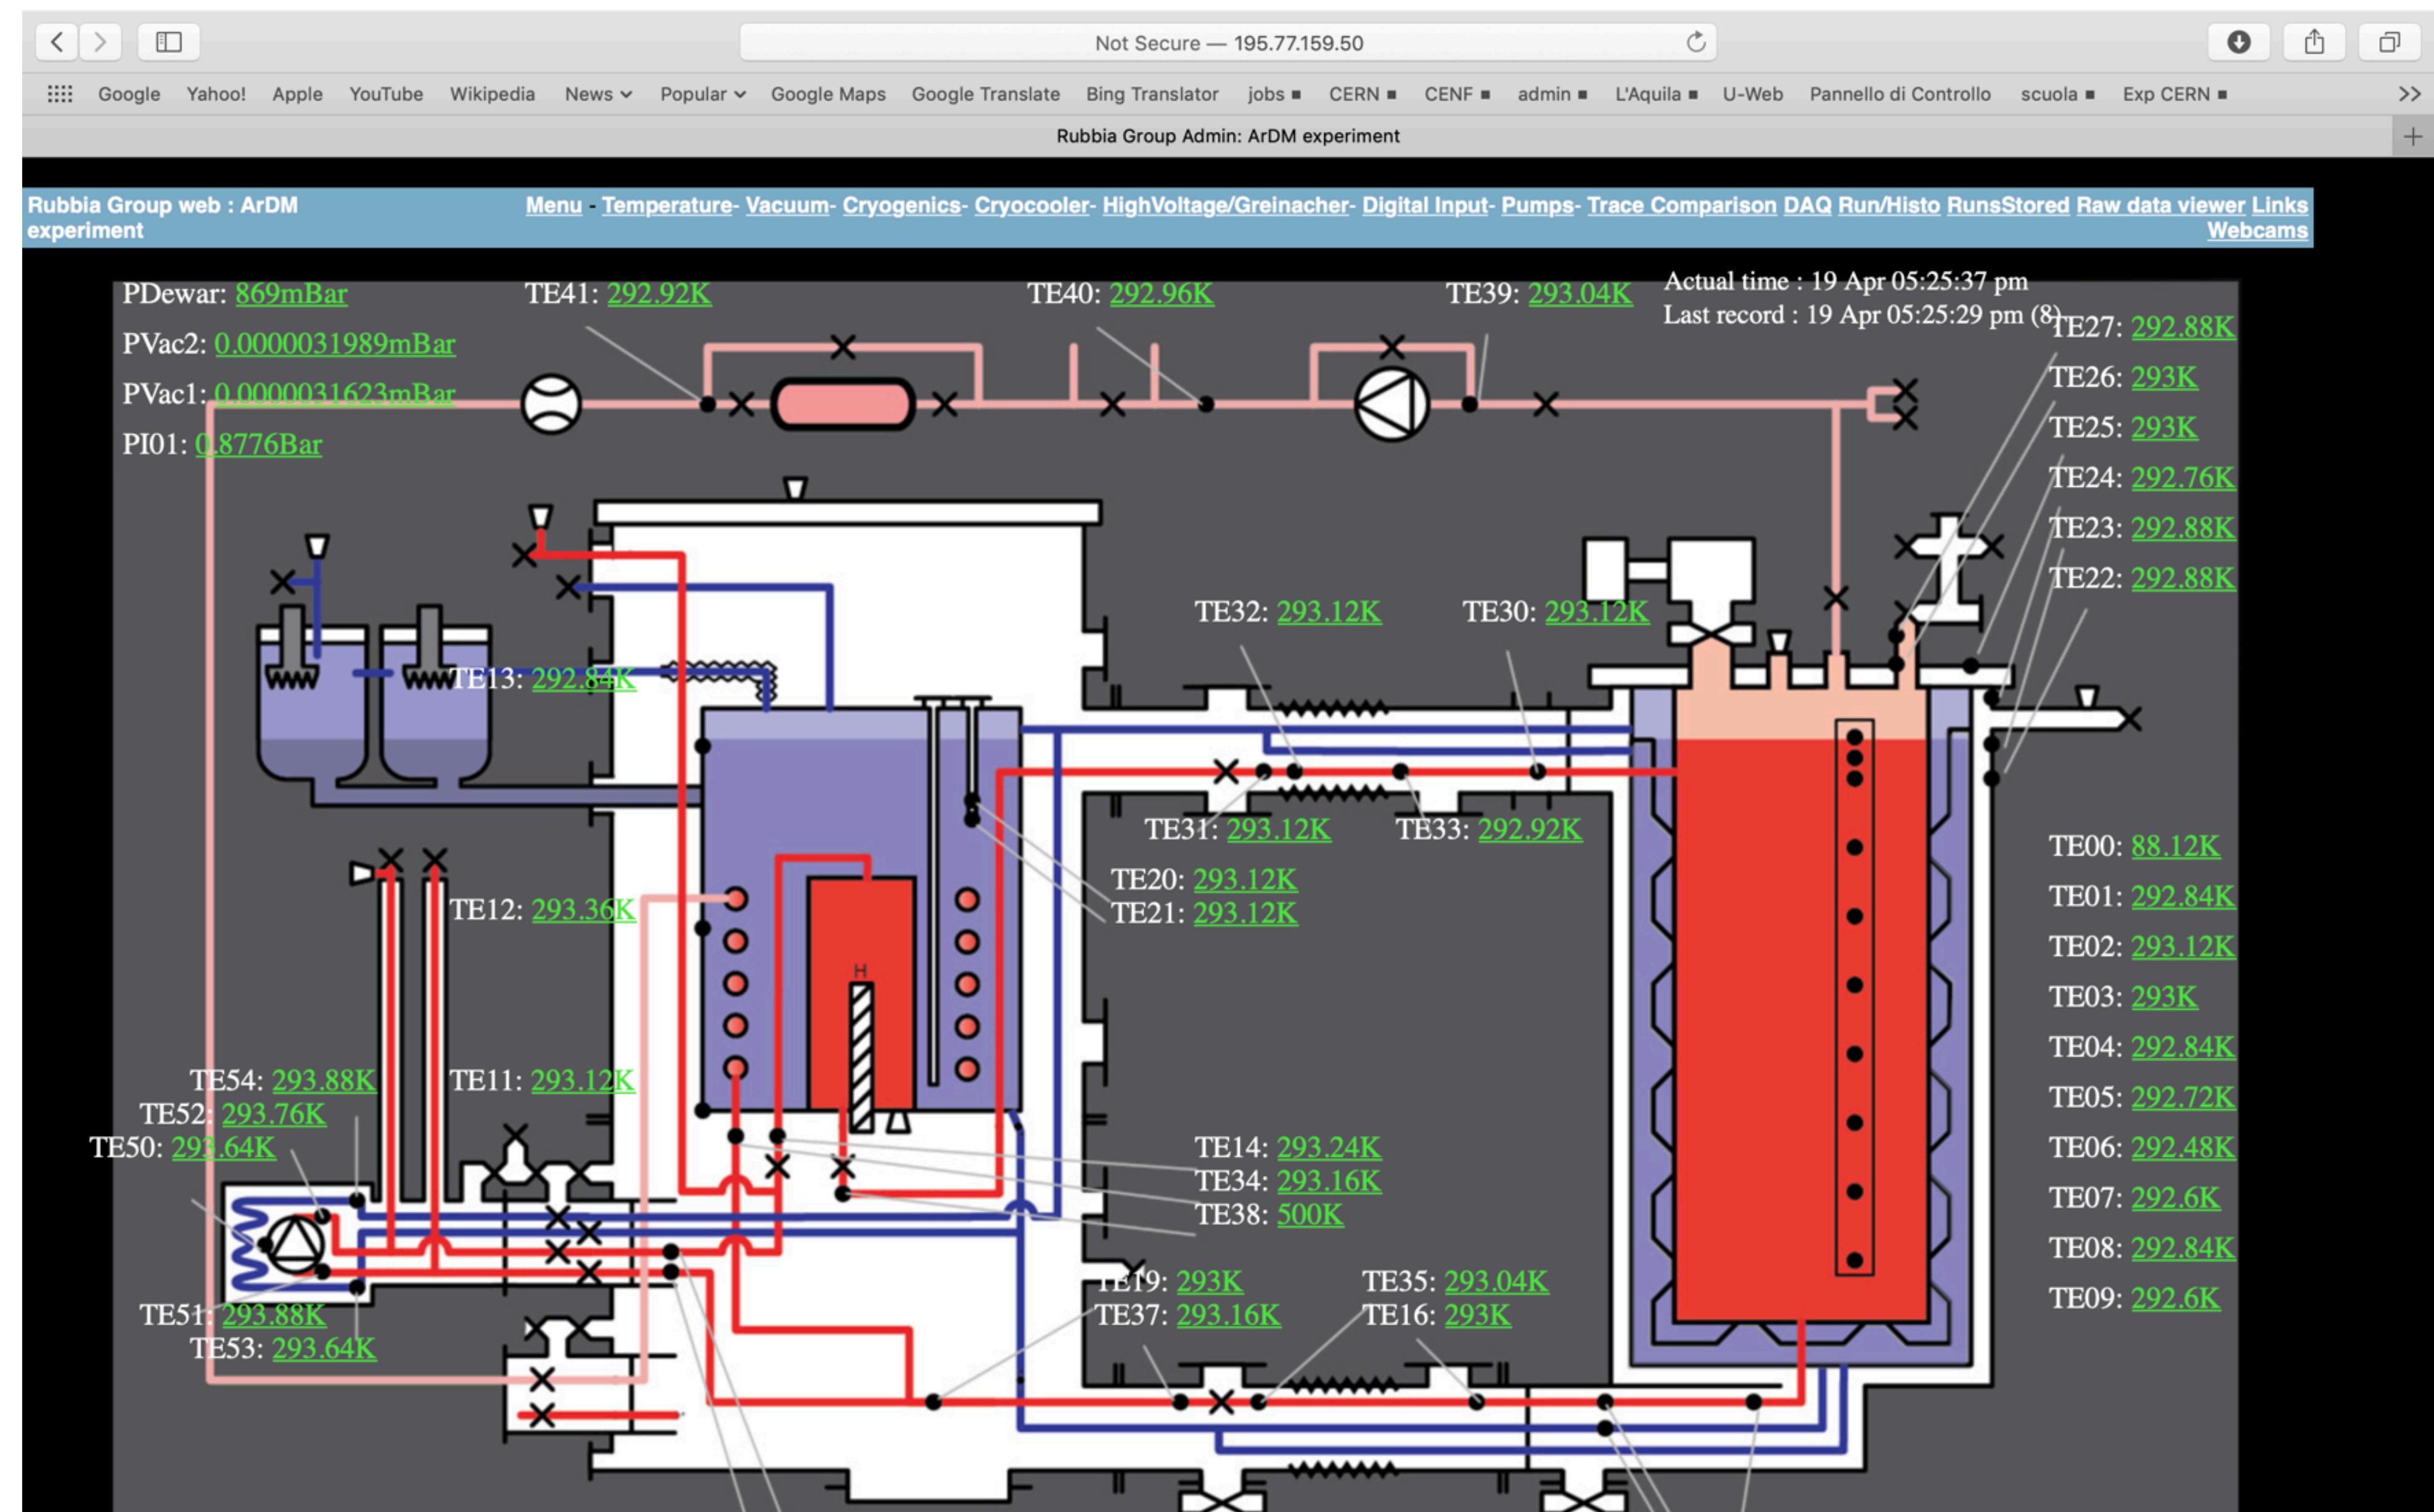

- PVSS is out of date
- Running on Windows XP – pcardm002
- Backup ?

Slow control

Web site

- Not a must but extremely useful
- History, database ?

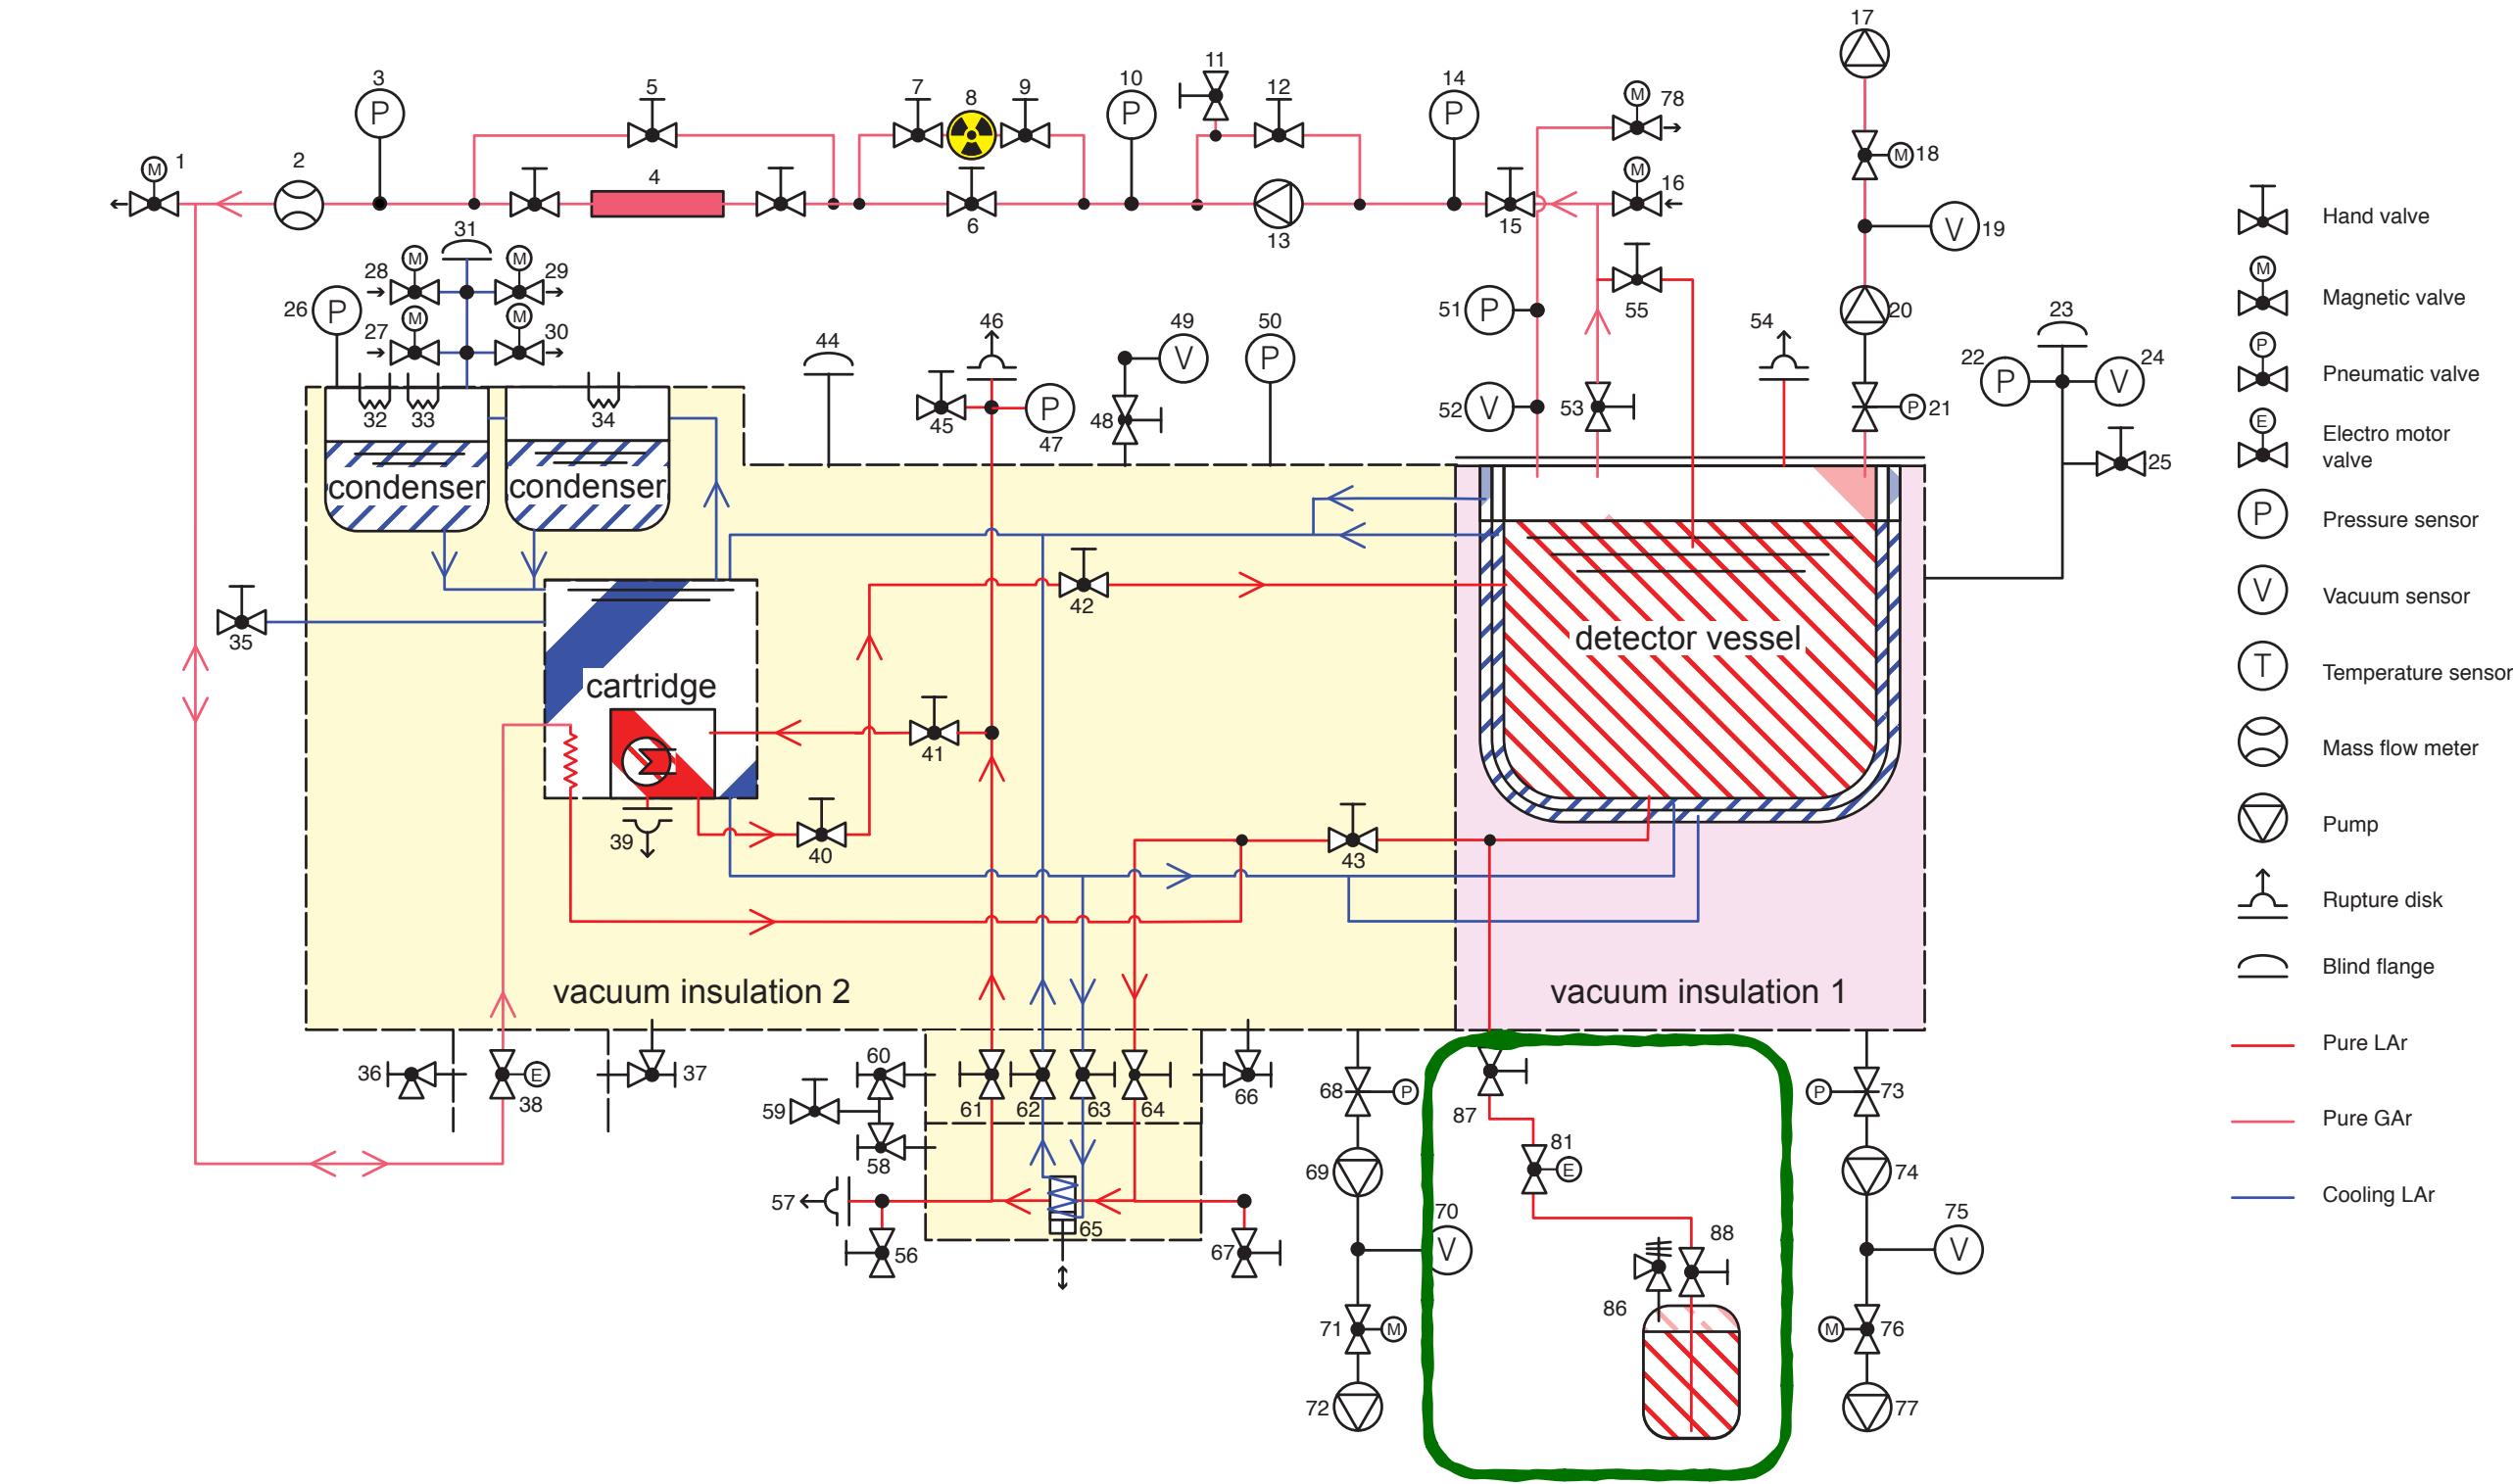

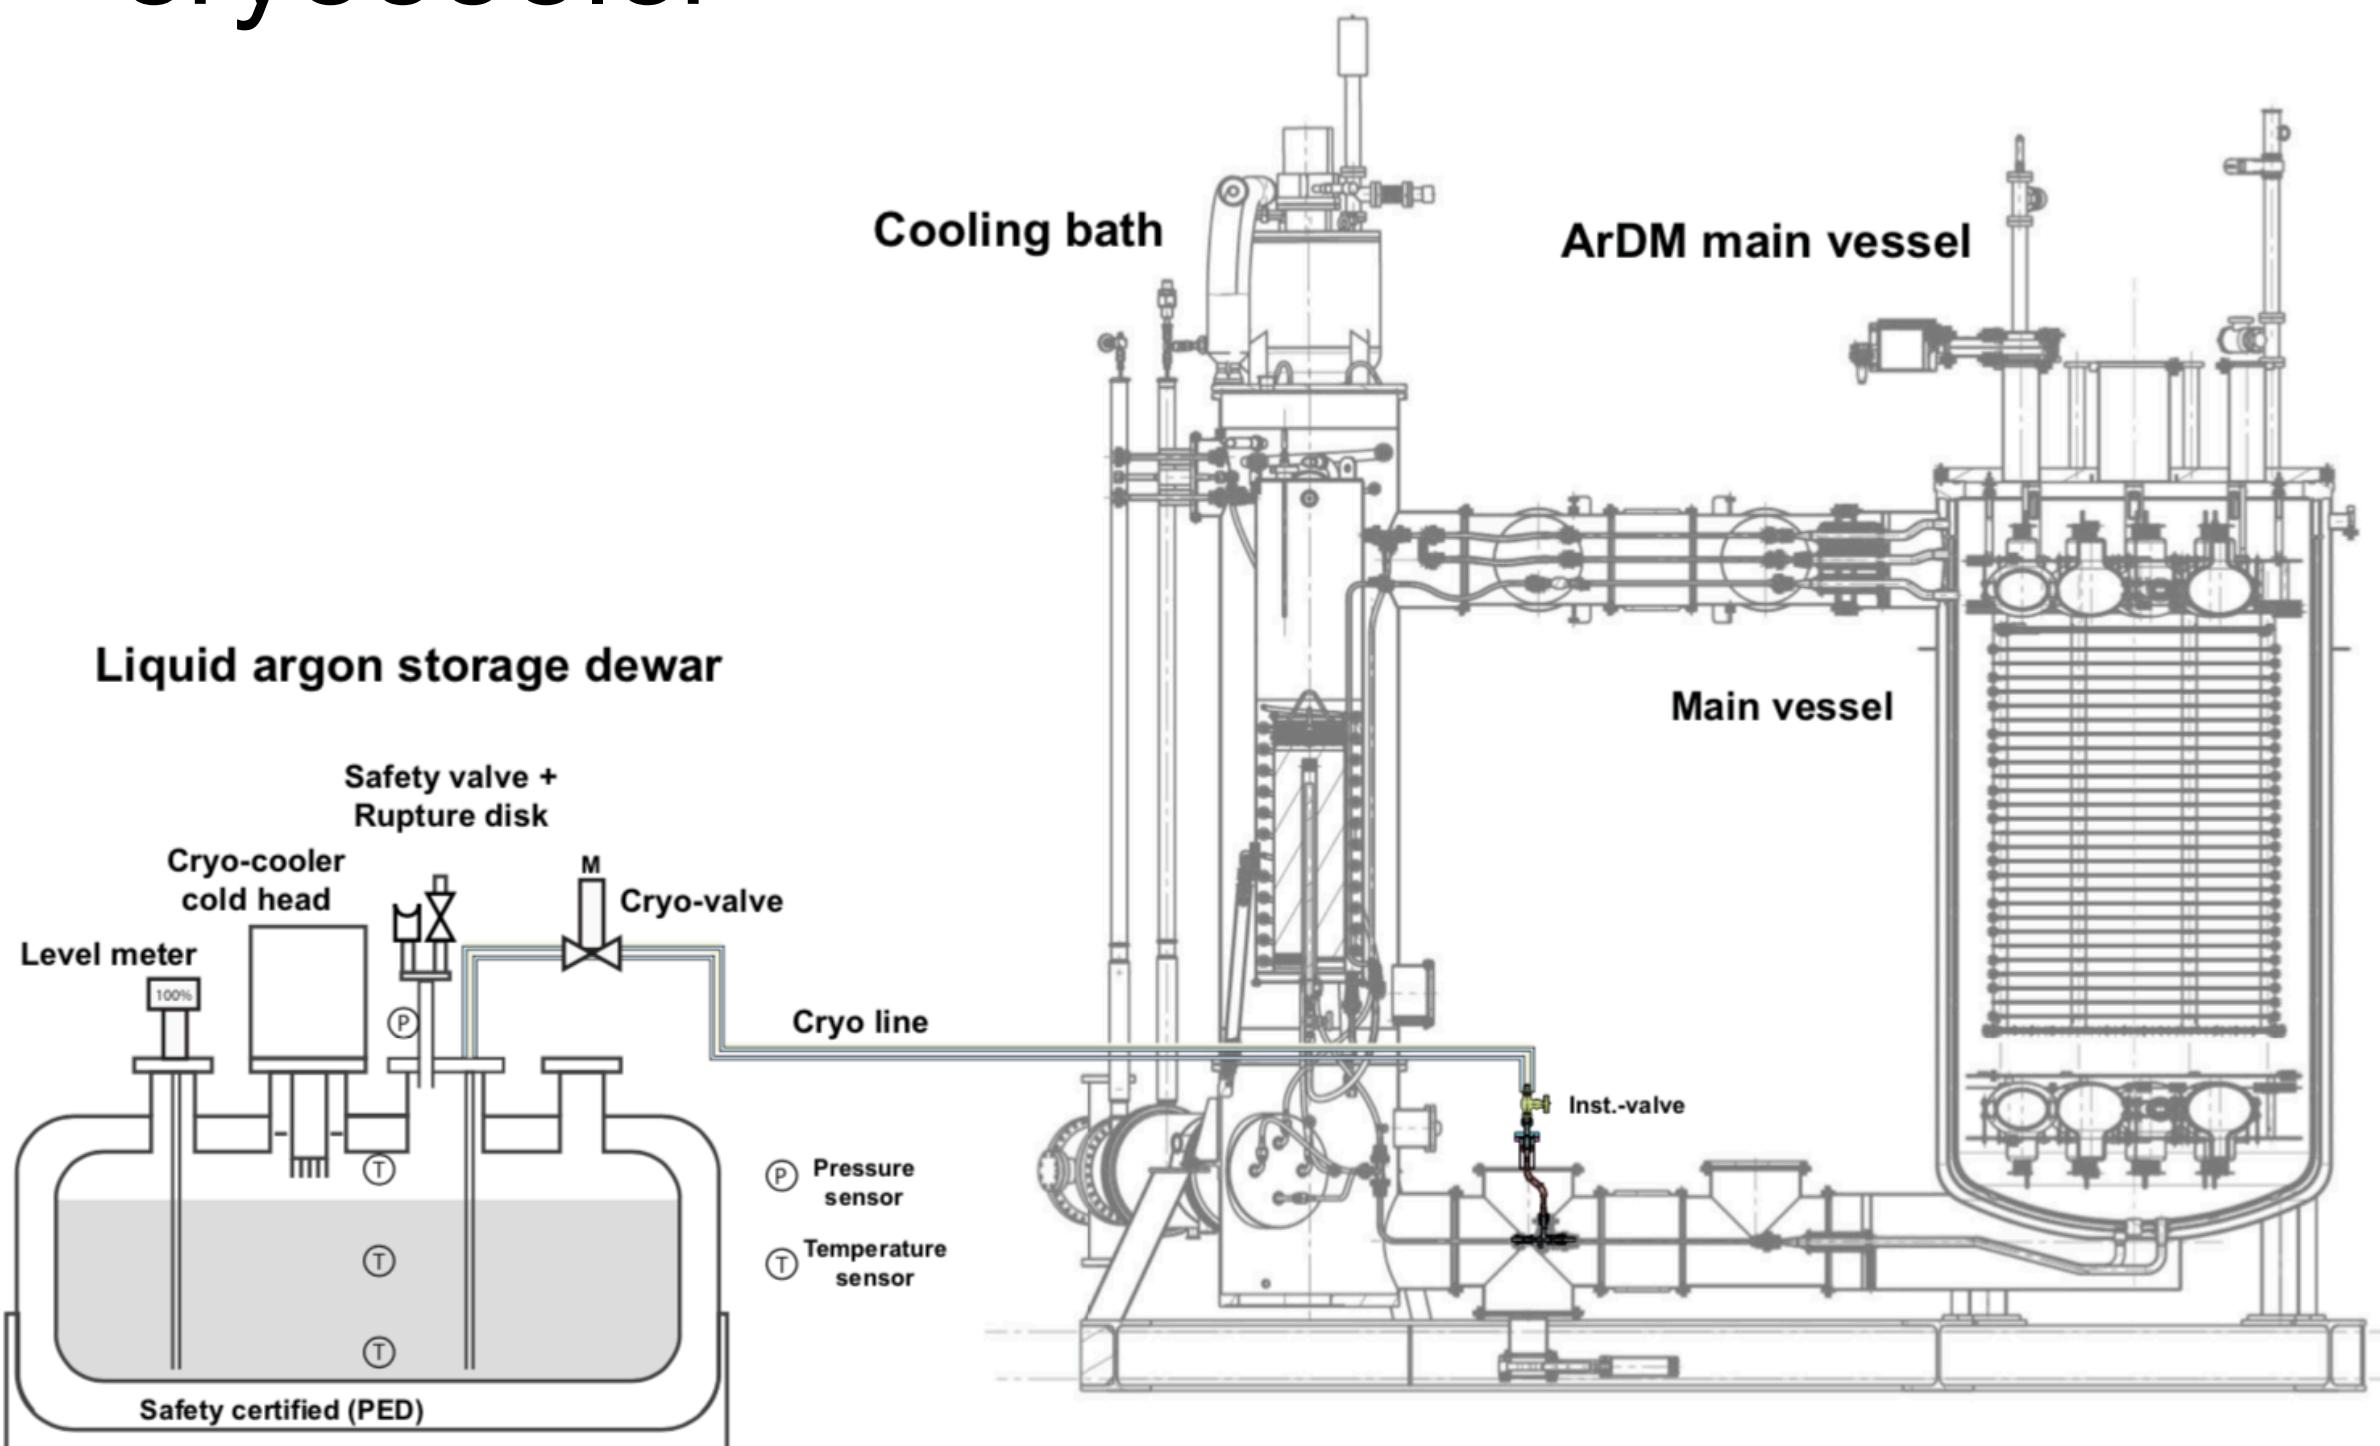

Operation steps

- Pumping
 - 2–4 weeks after the detector installation
- Filling of the bath (~200 L)
 - 1 week
 - Gaseous Ar from the battery is to be condensed
 - Need to procure the battery
- Filling of the pure Ar – from the recovery vessel
 - A couple of hours !
 - Do we have enough LAr ?

Recovery vessel

Refilling of the detector vessel

- The newest component
- Currently active with a dedicated cryocooler

ArDM Note 18-01-v2

Extension of the ArDM experiment with a LAr recovery dewar

Request for its installation in Hall A

W. Mu, C. Regenfus, A. Rubbia – ETHZ

July 24, 2018

Shifts ?

- Usually shifts were not organised except during the filling phases
- Experts on call must receive alarms
 - Need to organise

Recommissioning of the system

- Several issues are observed
 - Pressure gauges
 - Vacuum gauges
- UPS ?
- Need to evaluate the required time / cost

Done
